Specifically—2 (a) A large, strong rope or chain, such as is used to hold a vessel at anchor. Ropes made of hemp, jute, or coir were universally used in former times, but have now, except in small vessels and fishing craft, been superseded by chains. Chain cables are generally composed of 8 lengths of 15 fathoms each fastened together with shackles, making in all 120 fathoms. Swivels are inserted in the different lengths to prevent twisting. Cables are also for special uses, made of wires twisted together. (b) See *submarine cable*, below. (c) The traction-rope of a cable-railroad—3 In *arch*. (See *telegraph*) The copper wire, or embedded strand of wires, is called the *core*, and is insulated by layers of gutta percha or India rubber, each layer being separated from the next by a coating of insulating matter. The insulating layers are generally separated from the outer wires by a padding of jute or hemp saturated with fat or other protective substance. One wire is found to be better than a strand as regards conducting power, but the latter is safer since if one wire breaks, messages can still be conveyed through the others—*To bitt the cable* (*naut.*), to wind it around the bitts—*To bring a chain cable to the buoy*—*To buoy a cable*, to support it by floats to keep it clear from a rocky bottom, or to indicate by means of buoy and buoy rope the place where its end lies when detached from the ship—*To heave a cable short*. Its fruit is a somewhat pear-shaped pointed pod, 10 furrowed, from 5 to 10 inches long, and contains numerous large seeds embedded in a sweet pulp. Cocoa consists of the nibs alone, either unground or ground, dried, and powdered, or of the crude paste dried in flakes. Brown consists of the dry powder of the seeds after a thorough expression of the oil. A decoction is also made from the husks alone, under the name of *cocoa shells*. **Broken cadence**, in music, an interrupted cadence—**False cadence**, the closing of a cadence in another chord than that of the tonic preceded by the dominant—**Half cadence**, same as *imperfect cadence*. Also called *half close*—**Perfect, complete, or whole cadence**, the chord of the dominant followed by that of the tonic, also, the chord of the dominant seventh followed by that

of the tonic. These two forms of the perfect cadence were in ancient church modes called *authentic*, in distinction from the *plagal* cadence. An example of each form in C major is here given. The end of a piece should properly be a complete cadence, incomplete and interrupted cadences being suitable only as temporary endings for phrases or periods in the midst of a piece—**Imperfect cadence**, the chord of the tonic followed by that of the dominant, it rarely occurs as a final close—**Interrupted or deceptive cadence**, a cadence formed by a chord foreign to that which was expected, thus evading the close and deceiving expectation. Thus, in the example, the second chord has A in the bass instead of C, which is naturally expected. Also called *suspended cadence*—**Medial cadence**, a cadence in ancient church music in which the mediant was the most important note—**Mixed cadence**, a cadence in which a subdominant is followed by a dominant, and this by a tonic chord, so called from its being a combination of the authentic and plagal cadences of ancient church music—**Plagal cadence**, a cadence which con-

**2** In *her*., the relative status of younger sons

**Also** *brisure*—**Marks of cadency**, in *her*., bearings used to distinguish the shields of the second son, the third son, etc. This is sometimes effected by a bearing differing only in details on the shields of the different sons, as a label having three, four, or more points, to mark their respective order. It is also effected by means of a totally different bearing. Thus, in modern times it has been ordained that the eldest son should wear a label during the lifetime of his father, or until he inherits the paternal shield, without marks of cadency, the second son a crescent, the third a mullet, the fourth a martlet, the fifth an annulet, the sixth a fleur-de-lis, the seventh a rose, the eighth a cross moline, the ninth a double quarterfoil. The mark of cadency may become a permanent part of the shield if the younger son acquires estates of his own and builds up a family of consequence, thus the bordure, which is originally a mark of cadency, has often become a permanent bearing, and the shield which contains it bears now marks of cadency when borne by the sons of its possessor

**cadenza** (ka-den'zā), *n.* [*It see cadence*] In music, a more or less elaborate flourish or showy passage introduced, often extemporaneously, just before the end of an extended aria or concerto, or as a connective between an intermediate and a final division. It is always intended to display the technical proficiency of the performer, and to arouse wonder and applause, and hence, except in the hands of a master, is often deficient in intellectual or expressive character, as well as incongruous with the remainder of the piece. Modern composers, therefore, usually write out cadenzas in full, instead of trusting, as was customary in the seventeenth and eighteenth centuries, to the taste and readiness of singers and players. **cadmium** (kad-mi-um), *n.* [*NL, < L. cadmia see cadmia*] Atomic weight, 112.3, chemical symbol, Cd. A metal discovered by Stromeyer in 1817, resembling tin in color and general appearance, and, like that metal, having a "cry" when bent. The specific gravity of the cast metal is 8.62, of the rolled, 8.69. Its hardness is between that of gold and tin, and it is easily rolled to sheets or even to very thin foil. It fuses at about the same temperature as tin, 467° F., and communicates to various alloys the property of fusing at very low temperatures. (See *Wood's metal*, under *metal*) If 8 to 10 per cent of cadmium be added to Rose's metal, its fusing point is lowered to 167°. Cadmium is a common accompaniment of zinc ores, both blende and calamin, and it is in the smelting of these

that the commercial metal is obtained, which is done almost exclusively in Silesia and Belgium. Some kinds of blende contain as much as 3 or 4 per cent of sulphid of cadmium. This metal also occurs by itself naturally in combination with sulphur, forming the rare mineral called greenockite (which see). The manufactured sulphuret is of importance as furnishing a brilliant and permanent yellow color called cadmium yellow (see below). This is used by artists, also in coloring soap and to some extent in call printing. It is also used for giving a yellow luster to the surface of porcelain. The total produce of cadmium is supposed to be about two tons a year — *Cadmium blende*, the mineral greenockite

It was originally merely the Greek herald's staff, a plain rod entwined with fillets of wool. Later the fillets were changed to serpents, and in the conventional representations familiar at the present day the caduceus is often winged. The caduceus is a symbol of peace and prosperity, and in modern times figures as a symbol of commerce. Mercury being the god of commerce. The rod represents power, the serpents represent wisdom, and the two wings, diligence and activity. In heraldry it is blazoned as a staff having two serpents entwined about it, mutually respectful, and joined at the tails. It is a rare bearing

(See *floating dock*, under *dock*.) (c) A water-tight box or casing used in founding and building structures in water too deep for a coffer-dam, such as piers of bridges, quays, etc. The caisson is built upon land, and then chained and anchored directly over the bed, which has been leveled or piled to receive it. The masonry is built upon the bottom of the caisson, which is of heavy timber. As the caisson sinks with the weight, its sides are built up, so that the upper edge is always above water. In some cases the masonry is at first built hollow, and is not filled in until after it has reached its bed, and its sides have been carried higher than the surface of the water. Sometimes the sides of the masonry itself form the sides of the caisson. In another form the caisson, made of heavy timbers, is shaped like an inverted shallow box, having sharp, iron bound edges. The weight of the masonry for the caisson into the sand and mud on the bottom. Air under pressure is then forced into the caisson,

driving out the water and permitting the workmen to enter through suitable air locks. A sealed well or a pipe and sand pump are provided, through which the material excavated under the caisson may be removed. The latter gradually sinks under the weight of the superstructure and the removal of the loose soil below, until a firm foundation is reached, when the whole interior of it is filled with concrete. The caissons beneath the towers of the East River suspension bridge, connecting New York and Brooklyn, are of this description. The *pneumatic caisson* is an inverted air tight box, into which air is forced under a pressure sufficient to expel the water, thus leaving a space in which men can work to loosen the soil as the caisson descends. The principle of the pneumatic caisson is applied to the sinking of large iron cylinders to serve as piers or land shafts. Sometimes written *caisson*

Whether *Calamites* should be considered as being a peculiar form of *Equisetacea*, or as constituting a distinct but allied order, has not yet been fully established. The calamites are considered to have been cryptogamic plants, but their relations to living cryptogams are peculiar, and especially exceptional in their complex structure and the exogenous growth of the woody cylinder. The foliage of the calamites was verticillate, and it is thought by some that *Asterophyllites*, *Annularia*, and even *Sphenophyllum*, with their whorled leaves, represent the leaf bearing branches of calamites, although this has not been actually proved by discovery of the leaves attached to the stems. The calamites are among the commonest and most characteristic fossil plants of the coal measures.

The fruits of *C. Draco* yield the red resin known in commerce as dragon's blood.

4. A tube, usually of gold or silver, through which it was customary in the ancient church to receive the wine in communicating. The adoption of the calamus doubtless arose from caution, lest any drop from the chalice should be spilled, or any other irreverence occur. **calcium** (kal'si-um), *n.* [*NL*, *< L. calx (calo-), lime see calx and chalk*] 1. Chemical symbol, Ca; atomic weight, 40. A metal having a light-yellow color and brilliant luster, about as hard as gold, very ductile, and having a specific gravity of about 1.57. It oxidizes readily in moist air, and at a red heat burns vividly, forming calcium oxide, CaO, or quicklime, one of the alkaline earths. On adding water this forms calcium hydrate, Ca(OH)<sub>2</sub>, or slaked lime. Calcium is not found native in the metallic state, but it unites with most of the non-metallic elements in compounds which are widely distributed in nature and extensively used. The mineral calcite, all limestone or marble, and the chalk deposits are calcium carbonate, gypsum is calcium sulphate, and calcium also enters into the composition of nearly all the native silicates.

2. A calcium light. [Colloq.]—Calcium carbide, CaC<sub>2</sub>. It is used in making acetylene gas.—Calcium light,

a very intense white light produced by turning two streams of gas, one of oxygen and the other of hydrogen, in a state of ignition, upon a ball of lime. Captain Drummond, the inventor, proposed the use of this light in lighthouses. Another light, previously invented by him (1825), was employed in geodetical surveys when it was required to observe the angles subtended between distant stations at night. The light was produced by placing a ball or disk of lime in the focus of a parabolic mirror at the station to be rendered visible, and directing upon it through a flame of acetylene gas, a stream of oxygen gas. Also called *Drummond light*, *oxyacetylene light*, *limelight*, and *time light*.

4 To purpose, intend; design as, he calculates to do it; he calculates to go. [Local, U. S.]—

5 To think; guess. [Colloq., New Eng.]—*Syn.* 1 and 2 *Calculate, Compute, Reckon, Count.* *Calculate* applies to the most elaborate and varied mathematical processes as, to calculate an ellipse or a nativity. *Compute* is more applicable to the simpler processes as, to compute the interest on a note. But mathematicians make the opposite distinction, in their language, to compute means to make elaborate calculations with the art of a person trained to this business. *Reckon* is essentially the same as *compute*, but may be simpler yet as, to reckon interest, or the amount of a bill or the days to a coming event. To count is to reckon one by one. The figurative uses of these words are not suggested by any comparison of their literal meanings. In them all some mental estimate may be supposed to be made, akin to an arithmetical process. "I reckon that the sufferings of this present time are not worthy to be compared with the glory which shall be revealed in us." *Rom. viii. 18.* The use of *calculate* for *reckon* in such a case as this is an Americanism. "I count not myself to have apprehended." *Phil. iii. 13.* *Reckon* may be used in such a connection, but not the other two words.

**calculating-machine** (kal'kü-lä-ting-mä-shēn'), *n.* Any machine which performs numerical calculations. The principal kinds are (a) Multiplying and dividing machines. (b) Difference engines, which calculate and print tables from the initial values of the tabular number and its first, second, etc., differences. The first of these was that of Babbage, of which the Scheutz machine now at the Albany observatory, is a modification. (c) The analytical engine of Babbage, which was designed to calculate and print tables of a function from constants, but was never actually constructed. (d) Tide predicting machines, of which several have been constructed, with one of which, that of Ferrel, the regular tide tables published by the United States Coast Survey are now computed. (e) Machines for integrating differential equations, though these are rather instruments than machines. (f) Logical machines, for deducing conclusions from premises. There are also important instruments for performing calculations, which are not usually called machines. Such are the abacus, the celestial globe, and Hill's machine for predicting eclipses and occultations, used in the calculation of the American ephemeris (See *cut under abacus*). There are also various calculating scales, such as Napier's bones. Many of these devices are of considerable utility, such as Airy's stick for gauging cylindrical vessels, and the gaging rod. Some instruments perform calculations subsidiary to the process of measurement, as the planimeter.

**calculation** (kal'kü-lä'shon), *n.* [*< ME. calculacion, -tion, < L. calculatio(n-), < calculare, reckon see calculate, v.*] 1 The act of calculating, the art, practice, or manner of computing by numbers, reckoning, computation as, to find a result by calculation, the *calculatum* was a difficult one.

3 In *math*, any highly systematic method of treating a large variety of problems by the use of some peculiar system of algebraic notation. By the *calculus*, without qualification, is generally understood the *differential calculus*, invented by Leibnitz (al though Newton's method of fluxions comes virtually to the same thing). In this method quantities are conceived as varying continuously, and when equations exist involving several quantities these quantities will, in consequence of these equations, vary together so that there will be equations between their rates of change the differential or infinitely small increment of a variable being denoted by the letter *dx* written before the symbol denoting the variable. The differential calculus treats of the values of

ratios of these differentials, and of the fundamental formulas into which these ratios enter. The *integral calculus* treats of integration, or the summation of an infinite series of differentials, it is largely an inverted statement of a part of the doctrine of the differential calculus, but it also introduces imaginary quantities and leads up to the theory of functions — **Barycentric calculus** See *barycentric* — **Calculus of enlargement**, a method of obtaining algebraic developments, etc., by the use of *E* (see *calculus of finite differences*) and other symbols of operation

**Calculus of equivalent statements** Same as *calculus of logic* — **Calculus of finite differences**, a method of calculating, mainly by means of the symbols *E*, *Δ*, and *Σ*, the first, *E*, signifying the operation of increasing the independent variable of a function by unity, the second, *Δ*, the increase in the value of a function produced by increasing its variable by unity, and the third, *Σ*, the operation of adding all values of the function for integral values of the variable from unity up

The *calculus* of finite differences differs from the differential calculus, not merely in considering finite differences instead of differentials, but also in not assuming continuity — **Calculus of forms**, the theory of invariants, etc., treated symbolically after the manner of Jordan — **Calculus of functions**, a branch of the calculus of finite differences, a method of finding functions which fulfill given conditions — **Calculus of logic**, a method of working out conclusions from given premises by means of an algebraic notation — **Calculus of operations**, the general method of treating mathematical problems by operating algebraically upon symbols of operation — **Calculus of probability** See *probability* — **Calculus of quaternions**, the method of calculating by means of quaternions — **Calculus of variations**, a branch of the differential calculus, using *δ*, the sign of the variation of a function, for the solution of problems of maxima and minima — **Fluxional or fluxionary calculus** See *method of fluxions*, under *fluxion* — **Fusible calculus**, a variety of urinary concretion consisting of mixed ammonium magnesium and calcium phosphates. It is so named because it fuses before the blowpipe — **Imaginary calculus**, the method of calculating by the use of an imaginary unit, the square of which is supposed to be -1, and which is added and multiplied like a number — **Mulberry calculus**, a urinary concretion consisting chiefly of oxalate of lime. Many of these calculi in form and color somewhat resemble the fruit of the mulberry

**caldera** (kal-dā'ra), *n* [*Sp*, a kettle see *calderon*] A large kettle or caldron, hence, in *geol*, an amphitheatrical depression in a volcanic formation. The term was originally used in describing volcanic regions occurring where Spanish is the current language, and was introduced by Von Buch in his classic description of the Cuernavaca. Its use has been extended thence to other countries, and by it is understood a large amphitheatrical or kettle like depression occurring in volcanic rocks, surrounded by high and steep walls, which are usually more or less broken away on one side or cut through by deep ravines (*barrancas*). Calderas are generally admitted to be volcanic craters enlarged by the action of the sea after submergence of the mass, or by the action of subterranean disruptive forces

— **Calendar - amendment Act**, an English statute of 1751, which took effect in 1752, establishing January 1st as the beginning of each year (instead of Lady day, March 25th), adopting the Gregorian or "new style" in place of the Julian or "old style" calendar, and canceling the then existing excess of 11 days by making the 3d of September, 1752, the 14th. Also known as *Lord Chesterfield's Act*.

— **Calendar month**, a solar month as it stands in almanacs. — **Calendar moon**. Same as *ecclesiastical moon* (which see, under *ecclesiastical*). — **Ecclesiastical calendar**, an arrangement of the civil year employed by the liturgical churches to designate the days set apart for particular religious celebration. As many feasts of the church depend upon Easter, the date of which varies from year to year, either the calendar must vary every year or must contain simply the matter from which a true calendar can be computed for each year. In the Roman Catholic Church, special circumstances in the history of each nation affect its liturgical calendar, hence every nation, and to some extent every religious order and even every ecclesiastical province, has its own calendar. The German Lutheran Church retained at the Reformation the Roman Catholic calendar, with the saints' days then observed. The Church of England still retains in its calendar certain festivals, called black letter days, for which no service is prescribed, and which have been omitted by the Protestant Episcopal Church of America. See *Easter*. — **Gregorian calendar**, the reformed Julian calendar introduced by the bull of Pope Gregory XIII in February, 1582, and adopted in England in September, 1752, the "new style" of distributing and naming time. The length of the year of the Gregorian calendar is regulated by the Gregorian rule of intercalation, which is that every year whose number in the common reckoning since Christ is not divisible by 4, as well as every year whose number is divisible by 100 but not by 400, shall have 365 days, and that all other years, namely, those whose numbers are divisible by 400, and those divisible by 4 and not by 100, shall have 366 days. The Gregorian year, or the mean length of the years of the Gregorian calendar, is 365 days, 5 hours, 49 minutes, and 12 seconds, and is too long by 26 seconds. The Gregorian rule has sometimes been stated as if the year 4000 and its multiples were to be common years. This, however, is not the rule enunciated by Gregory. The Gregorian calendar also regulates the time of Easter, upon which that of the other movable feasts of the church depend, and this it does by establishing a fictitious moon, which is purposely made to depart from the phase of the true moon in order to prevent the coincidence of the Christian Paschal feast with that of the Jews. — **Hebrew calendar**, the luni solar calendar used by the Jews since the second century of the Christian era. The years, numbered from the creation, are either ordinary, containing 12 lunar months and 354, 355, or 356 days, or embolismic, containing 13 lunar months and 383, 384, or 385 days. In every cycle of 19 years 7 are embolismic, to bring lunar and solar time into agreement. To find the number of the Hebrew year beginning in the course of a given Gregorian year, add 3761 to the number of the latter. — **Julian calendar**, the solar calendar as adjusted by Julius Caesar, in which the chronological reckoning was first made definite and invariable, and the average length of the year fixed at 365½ days. This average year (called the *Julian year*) being too long by a few minutes, the error was rectified in

Part of a Calendar of the 19th century (July). — From portal of Amiens Cathedral.

the Gregorian calendar. The Julian calendar, or "old style," is still retained in Russia and Greece, whose dates consequently are now 12 days in arrear of those of other Christian countries. — **Mohammedan calendar**, the lunar calendar employed in all Mohammedan countries, though there is another peculiar to Persia. The years consist of 354 or 355 days, in the mean 354½. The beginning of the year thus retrogrades through different seasons, completing their circuit in about 34 years. They are numbered from the *hejira* (which see), the first day of the first year being July 16th, A. D. 622. The 1900th year began Sunday, November 12th, 1882. — **Republican calendar**, the calendar of the first French republic. The year consisted of 365 days, to which a 366th was to be added "according as the position of the equinox requires it," so that the year should always begin at the midnight of the Paris observatory preceding the true autumnal equinox. The numbers of the years were written in Roman numerals. The year I began September 22d, 1792, but the calendar was not introduced until October 5th, 1793. Every period of four years was called a *franchise*. The years of 366 days were called *sextile*. There were 12 months of 30 days each, and 5 or 6 extra days at the end called *sansculottides*. The names of the months, beginning at the autumnal equinox, were Vendémiaire, Frumaire, Frimaire, Nivose, Pluviose, Ventose, Germinal, Floral, Prairial, Messidor, Thermidor and Fructidor.

**calendar<sup>1</sup>** (kal'en-där), *n.* [*F. calandre*, *calendrier*, *a. calender*, a corruption of *L. cylindrus*, a roller, cylinder; see *cylinder*] 1 A machine consisting of two or more cylinders or rolls revolving very nearly in contact, between which are passed woven fabrics, paper, etc., for preparation or finishing by means of great pressure, often aided by heat communicated from the interior of the cylinders. The object of the calendar for cloth and paper is to give the material a perfectly smooth and equal surface, and sometimes to produce a superficial glaze, as in certain cotton and linen fabrics and what is specifically called *calendar paper*, or a wavy sheen, as in watered silk, etc. The larger rolls in such a calendar are usually made of solidified paper or pasteboard turned exactly true, with intermediate cast-iron cylinders. Calendars are attached to paper-making machines for expressing the water from the fitted web of paper, and for the finishing processes of smoothing and glazing. They are also used for spreading India rubber into sheets suitable for making rubber fabrics, etc.

The calendars are wanderers who preach in the market-places and live by alms. Though the title *Calendar* asserts for its bearers a life of great purity, the members of this order, even before the death of its founder, fell into the grossest licentiousness and debauchery, and have not hesitated at assassination. They hold that salvation is as little affected by vice and crime as by virtue and holiness, and that sin stains the body only and can be removed by ablutions.

From this the days of the preceding month were counted backward to the *Ides*, which in March, May, July, and October corresponded to the 15th, and in all the other months to the 14th day of the month. Thus the 16th day of March by our reckoning was in the Roman calendar the 17th day before the calends of April (the first of April being included), or more briefly the 17th calends, the 14th day of January was the 19th day before the calends of February, the 14th day of any month with thirty days being the 18th before the calends of the succeeding month.

1 The diameter of a body, especially of the hollow inside of a cylinder, as, the *caliber* of a piece of ordnance or other firearm. In the United States the caliber of a firearm is expressed in decimal parts of an inch, thus, a rifle of 44 inch caliber (often shortened to "a 44 caliber rifle," "a 32 caliber pistol," etc.), of a cannon, either by the diameter of its bore, as a 10-inch gun, or by the weight of a solid round shot which it can carry, as a 12 pounder. In Great Britain the calibers of small arms are commonly expressed in decimal parts of an inch, of field guns, by the weight of a solid round shot which will fit the bore, as a 6-pounder, of heavy guns, in tons, as a 38 ton gun or a 100 ton gun. In France and in other countries on the continent the caliber is expressed in millimeters or centimeters.

**calico-printing**

(kal'i-kô-prin'-ting), *n.* The art of impressing designs in color upon cloth.

The simplest method is the use of engraved wooden blocks, pressed upon the cloth by hand. A separate block is required for each color.

Block printing has also been effected by means of machinery.

For most work a cylinder press is used. The patterns are engraved upon the surface of copper rollers, and the movement of the cloth is continuous and rapid.

The colors used are either substantive or adjective; the former have an affinity for the cloth, and by themselves adhere and form permanent dyes, the latter will not of themselves adhere to the fibers, or, if they do, are not permanent, but require to be fixed by mordants.

The various styles of printing are called the *bandana*, *china-blue*, *discoloring*, *discharge*, *maider*, *padding*, *resist* style, etc.

Calico-printing Machine, adapted for two pattern rollers.

The cloth is unwound from roller *A*, and passes beneath the smooth roller *B*, receiving an impression from each of the two rollers *C*, *E*, as it passes. The roller *A* runs in journal-boxes which are regulated by a set-screw *F* at each end, and a smoothing roller *G*, actuated by a set-screw *H*, holds the cloth against the roller *A*. The pattern-rollers, *C*, *E*, are inked by the aprons *I*, *J*, which pass over the rollers *C*, *E*, the outside surfaces of the aprons coming in contact with the surfaces of the rollers *C*, *E*, which revolve in the ink troughs, *K*, *L*. After receiving the impressions from the pattern-rollers, *C*, *E*, the cloth, as *m*, is led off to be dried and folded.

In the ice calorimeter the substance to be operated on is enclosed in a cavity of ice and the quantity of heat is determined by observing the increase of volume due to the melting of a portion of the ice. In other forms the rise in temperature of a known quantity of some liquid, as water or mercury, or the amount of expansion caused in a known volume of mercury, is noted.

**calorimetric, calorimetric** (kal'ō-ris-i-met'rik, -i-kal), *a* Of or belonging to the calorimeter or to calorimetry.

There are two methods of measuring the intensity of a beam of light. 1. *Calorimetric*. 2. *Photometrical*. *A. Daniell, Prin of Physics*, p. 461.

See *motor*] A form of voltaic battery, consisting of one or more cells in which the plates used are large, so that the internal resistance is very small. The current produced may have a low electromotive force while the quantity of electrical energy is large, and hence can produce considerable heating effects in a short external circuit. Here a deflagrator was an early form.

**calorist** (kal'ō-ris't), *n* [*< L. calor*, heat + *-ist*] One of those who uphold the theory that the sensation and phenomena of heat are attributable to a fluid called caloric.

**calory** (kal'ō-ris), *n* [*< F. caloric*, < *L. calor*, heat] In *phys*, the quantity of heat necessary to raise the temperature of a kilogram of water from 0° to 1° centigrade. It is the unit of heat ordinarily employed in calorimetry by modern physicists, instead of the thermal unit based on the English measure (See *thermal*). The small calory or thermal unit on the C & G system is the heat required to raise the temperature of one gram of water from 0 to 1 C. Although this particular degree of the scale is always specified in formal

definitions, yet it is practically assumed that the specific heat of water is constant, so that if the calory were defined in terms of the degree from 20 to 21°, it would more accurately represent the meaning in use. Also spelled *calorie*.

The Caloric is equal to 41,693,010,000 ergs or 428,885 kilogramme metres. *A. Daniell, Prin of Physics*, p. 317.

Kuam ing Ground beetle (*Calosoma scrutator*) with larva of *C. calidum* (Natural size)

*C. scrutator*, and *C. calidum* are other species of this widely distributed genus, commonly called ground beetles. Also spelled *Calosoma*.

**calote**, *n* Same as *calotte*.

**Calotermes** (kal'ō-ter'mēz), *n* [NL, < *Gr καλός*, beautiful, + *L. termes*, termite, a wood-worm. See *termes*] One of the principal genera of white ants or termites, of the family Termitidae or isopterous Neuroptera. It contains both winged and wingless individuals and apterous, fully developed, but sexually aborted individuals. *C. flavipes* of South America is an example.

The nests of species of *Calotermes* are the most intricate, they only gnaw passages in wood, which mainly run in the direction of the axis of the tree. There is no special place for the queen. *Claus, Zool (trans)*, p. 560.

**Calotropis** (ka-lō'trō-pis), *n* [NL (in allusion to the keel of the flower), < *Gr καλός*, beautiful, + *τροπή*, a ship's keel, < *τρέπιν*, turn] A small genus of asclepiadaceous shrubs. The bark, which is known as *madar* and *geretum* (names also given to the plants themselves) is a medicine famous among Oriental physicians. It is employed in many diseases especially in dysentery, as an alternative tonic and diaphoretic and as a substitute for opium. *C. procera* ranges from India to the Cape Verde Islands, and *C. pinnatifida* from India to Borneo and China. The silky fiber of the latter is finer in quality, and is used for the robes of the native princes, for bowstrings, and for fishing lines and nets, as it is almost indurated in water. The peculiar characteristics of his system, as derived from

Calves tongue Molding, Kenilworth Church, England

his "Institutes" are his doctrines of original sin, namely, that we derive from Adam "not only the punishment, but also the pollution to which the punishment is justly due"; of freedom of the will, namely, that man "in his present state is despoiled of freedom of will and subject to a miserable slavery" of grace, or that "the Lord both begins and completes the good work in us," and gives us "both will and power" of predestination, or "the eternal decree of God, by which he has determined in himself what he would have become of every individual of mankind and of perseverance, or the doctrine that all the elect will certainly be saved. Calvinism has, however, been materially modified since Calvin's day, and the name is applied to modern systems of theology which differ more or less widely from his system in each of these particulars (See *Calvinism*). Generally, Calvinism may be said to rest upon the absolute sovereignty of God over all his creatures. It is in a modified form the theological system of most Baptists, Presbyterians, and Congregationalists.

If Arminianism most commends itself to our feelings, Calvinism is nearer to the facts, however harsh and for bidding these facts may seem.

American Congregationalists and the so-called New School Presbyterians are generally moderate Calvinists.

It is now known to be not a fluid, but a layer of extremely delicate thin-walled cells, filled with protoplasm and organized with a thin film of cellulose. These cells develop on the one side into a layer of new wood and on the other of new bark, while at the same time fresh cambium is formed for the continuation of the work. It is by the renewal of this process year after year that the increase of growth in the stem is effected, as indicated by its concentric rings. In the primary fibrovascular bundles of the stem a similar layer of cambium, with the same function, is always found between the woody and cellular portions

Arabian Camel or Dromedary (*Camelus dromedarius*)

*mal* = Ar *jamal*, *jemel* = Coptic *gamul*, a camel. In the older Teut languages the camel was

called by a name derived from that of the elephant. Goth. *ulbandus* = OHG *olbēnta*, MHG. *olbente* = AS *olbēnt* = OS *olbēnt* = Icel. *ál-falds*, a camel.] 1. A large ruminant quadruped of the family *Camelidae*, genus *Camelus*, used in Asia and Africa as a beast of burden. There are two distinct species of camels: (1) The Arabian camel, *C. dromedarius*, with one hump and four callouses on the fore legs and two on the hind legs. It is a native of Arabia, and is now known only in the domesticated state, it is used chiefly in Arabia and Egypt. There are several breeds or artificial varieties. The dromedary is one of these, being simply a "blooded or thoroughbred camel of great speed and bottom, used as a saddle animal, and comparing with the heavier and slower varieties as a race horse does with a cart horse. It is not a different animal zoologically speaking. (2) The Bactrian camel, *C. bactrianus*, with two humps, of which there are also dif-

ferent breeds. The name *camel* is sometimes applied to the species of the American genus *Acraea*, as the llama, alpaca, and vicuña, collectively known as the camels of the new world. The Arabian camel is poetically called the ship of the desert (and is constitute the riches of an Arabian, without them he could not subsist, carry on trade, or travel over sandy deserts. Their milk and flesh are used for food and their hides for leather, and their hair is a valuable article of trade and manufacture. By the camel's power of sustaining abstinence from drink for many days, due to the reserve it can carry in its peculiarly constructed cellular stomach, and of subsisting on a few coarse, dry, prickly plants, it is especially fitted for the parched and barren lands of Asia and Africa. Camels carry from 600 to 1,000 pounds burden.

2 A water-tight structure placed beneath a ship or vessel to raise it in the water, in order to assist its passage over a shoal or bar, or to enable it to be navigated in shallow water. It is first filled with water and sunk alongside the vessel, to which it is then secured. As the water is pumped out, the camel gradually rises, lifting the vessel with it. Camels have also been used for raising sunken vessels — *Camel's hair*, the hair of the camel, from which very fine fabrics, especially shawls, are made in the East, and also carpets, tent-cloths, etc. In Europe it is used chiefly for mixing with silk. An engraving in relief upon a gem, a hard stone of moderate size, or a similar material, or the object itself so engraved, as distinguished from an *intaglio*, specifically, such an engraving upon a stone or a shell having two or three layers differing in color, such as an onyx, agate, etc., and so treated as to utilize the effect of the variety of coloring. Cameos on stone are called *stone cameos*, in contradistinction to the *shell cameos*, or those cut on shells which have supposed layers varying in color, such as the *Cassius yufa* which gives red on sardonyx, the *Cassius madagascariensis*, white on dark claret, the *Cassius cornuta*, white on orange, the *Strombus gigas*, white on pink, and other tropical shells. Cameos in distinct bands of colors have been produced since about 150 B. C., and some of the ancient examples, as the *Sainte Chapelle* agate, in Paris (13 by 11 inches), representing the apothecosis of Augustus, and the *Vicinia onyx* (9 by 8 inches), representing allegorically the coronation of Augustus, surpass in size and in delicacy of execution the best modern specimens.

Photographic cameras are made in a great variety of shapes and sizes, according to use, as the *pocket camera*, *copying camera*, *landscape camera*, and *portrait-camera*, and many different forms of lenses, some of highly specialized types, are used. Provision is made for inserting in the back of the camera carriers or plate holders containing the dry or wet sensitive plates or the paper films, etc., on which the photographs are taken. See *camera obscura*, below, and *photography*.

4. In *anat.* (a) The so-called fifth ventricle of the brain, between the lamina of the septum lucidum. It consists of a solid prismatic piece of glass mounted upon a brass frame. The prism has its angles so arranged that the rays from the object appear reflected as shown below, and is covered at the top by a metallic eyepiece, the hole in which lies half over the edge of the prism, so as to afford a person looking through it a view of the picture reflected through the glass, and a direct view of his pencil or tra-

cing point. In the figure the object to be traced, *f*, is opposite the perpendicular surface of the prism, *d*, and the rays proceeding from *f* pass through this surface and fall on the inclined plane *e*, which makes an angle with *d* of 67½°, from this they are totally reflected to the plane *b*, which makes an angle of 195° with *d*, and are again reflected to the eye at *e* above the horizontal plane, which makes an angle of 67½° with the plane *a*. The rays of light from the object proceeding upward from *f* toward the eye of the observer, he sees the image at *n*, and by placing the paper below in this place the image may be traced with a pencil. The brass frame of the prism has usually two lenses, one concave and the other convex, the former to be used in front between *f* and *d* for near-sighted persons, and the latter at *e* for those who are far-sighted. The size of the picture may also be increased or diminished by lengthening or shortening brass tubes connected with the frame. This instrument has undergone various modifications. It is extremely convenient on account of its portability. — **Camera obscura** (Latin, dark chamber), an apparatus in which the images of external objects received through a convex lens, are exhibited distinctly and in their natural colors on a white surface placed at the focus of the lens. The simplest form of this instrument consists of a darkened chamber, into which no light is permitted to enter except by a small hole in the window shutter. An image of the object opposite the hole will then appear on the wall, or on a white screen so placed as to receive the light coming from the opening. A convex lens may be fixed in the hole of the shutter. Portable cameras are constructed of various forms, but the design of them all is to throw the images of external objects, as persons, houses, trees, landscapes, etc., upon a plane or curved surface, for the purpose of drawing the making of photographic pictures, or mere amusement. The surface on which the image is thrown may be covered with a sheet of paper, on which the figure may be traced by hand with a pencil, but the picture is most distinctly seen when the image is formed on the back of a silvered mirror. The figure represents a portable camera obscura. The camera obscura is often made in the form of a circular building capable of holding a number of people, who stand about a plain white table which is placed in the center of the structure, and on which the luminous image is projected by a lens on the roof. By turning the lens around a panorama of the neighboring scenery is exhibited on the table. Cameras for use in sketching are made in the shape of a cone, with a lens and a reflecting mirror at the apex and a drawing table inside. One side of the box is cut out, and at this opening the artist sits, partly enveloped by a dark curtain which serves to shut out extraneous light. See *optograph*.

The exposure is made by means of a spring the object to be photographed being brought within the range of the lens by means of a shutter variously devised. — **In camera**, *in loco*, in chambers. In private applied to a trial conducted with closed doors for some special reason touching the nature of the case or the evidence. — **Multiplying camera**, in *photog.*, a camera fitted with a number of small lenses, so that it can take a number of pictures at one exposure. Such stands vary in height from those of only a few inches, and intended to rest upon a table or shelf, to those of 4 feet or more, which raise the lamps to a height sufficient to illuminate an apartment. In general, such candelabra consist of a long shaft or rod rising from a base with three feet, and supporting a circular cap or disk with elaborate ornamentation. Some examples are of enormous size and weight covering at the base a triangle of 6 or 7 feet on each side, and reaching to a proportionate height, these, often made of marble, were used in connection with religious observances and were rather monuments or votive offerings than utensils.

2 Any branched candlestick differing from a chandelier or bracket in resting upon a foot.

Some very beautiful candelabra exist in churches most commonly made to hold seven candles. One in Milan cathedral, of bronze, dating from the twelfth century is perhaps the richest in existence. The "seven branched candlesticks" of the Hebrews (see *candlestick*) are properly candelabra.

3 Free from undue bias, fair, just, impartial of persons or their acts as, a *candid* view or construction.

*Candid* and dispassionate men. Irving.

—Syn. 2 and 3. *Candid*, *Fair*, *Open*, *Frank*, *Ingenuous*, *Native*, *Sincere*, *unprejudiced*, *unbiased*. The first seven words apply to the spirit, expression, or manner. The *candid* man is able to look impartially on both sides of a subject, especially giving due weight to arguments or opinions opposed to his own, and due credit to the motives of opponents, *candid* speech is essentially the same as *frank* speech, sometimes going so far as to be blunt. *Fair* belongs primarily to conduct, but in regard to speech and thought it is the same as *candid* as, a man preeminently fair in dealing with opposing views. *Open* is opposed to concealment, the *open* man does not cultivate a political reserve, but expresses his opinions freely, without stopping to think of their effect upon his own interests. *Frank*, literally, *free*, the freedom may be in regard to one's own opinions, which is the same as *openness*, or in regard to things belonging to others, where the freedom may go so far as to be unpolite, or it may disregard conventional ideas as to rectitude. Hence while *openness* is consistent with timidity, *frankness* implies some degree of boldness. *Ingenuous* implies a permanent moral quality, an elevated inability to be other than honest or open, even to one's own loss. There is a peculiar subjective cast to the word, as though the man stood most in awe of the disapprobation of his own judgment and conscience, hence the close connection between *ingenuousness* and *modesty*. *Native* expresses a real or an assumed unconcernedness of the way in which one's words meet conventional rules, or of the construction which may be put upon them by others, *native* is thus an openness or frankness proceeding from native or assumed simplicity or artlessness. *Sincere* expresses the spirit and language that go with the love of truth, the *sincere* man is necessarily *candid* and fair, and as open and frank as seems required by truth.

He [Dryden] was, moreover, a man of singularly open soul and of a temper self-confident enough to be *candid* even with himself. Lowell, Among my Books, 1st ser., p. 7.

**cannibalism** (kan'i-bal-izm), *n* [*< cannibal + -ism*] 1. The eating of human flesh by human beings.

It is rather startling to find that just two hundred years ago in London the Physician in Ordinary to the King recommended *cannibalism* to Englishmen without the smallest apology or hesitation.

F. P. Cobbe, Peak in Darien, p. 179

Hence—2 The eating of any animal by another individual of the same species.

In the minor senses 2, 3, 4, etc., also spelled *canon*, but prop. *cannon*. In the sense of 'cannon-bone,' cf. *It. cannoth* (Florio), cannon-bones, *cannella*, arm-bone (cf. *cannel<sup>2</sup>*).] 1. An engine, supported on a stationary or movable frame called a *gun-carriage*, for throwing balls and other missiles by the force of gunpowder; a big gun; a piece of ordnance. Cannons are made of iron, brass, bronze, steel, or steel wire, and carry balls of from 3 or 4 pounds weight up to 2,000 pounds and more. The caliber or power of cannon may be expressed (1) by the

weight of the shot fired as, a 32-pounder, (3) by the diameter of the bore as, a 12-inch gun, or (3) by the weight of the gun itself as, an 8-hundredweight gun, a 25 ton gun. Before the introduction of armor plating, the naval guns in use in line-of-battle ships and frigates were 68-pounders (65 hundredweight), 8-inch shell-guns (65 hundredweight),

and 32 pounders (42 to 58 hundredweight). Now ships are said to carry 6-inch, 12 inch, etc., or 18-ton, etc., guns, the 18-ton gun throwing 400-pound projectiles, and the 25-ton gun 600 pound, and so on, the weight of the ball rising with the weight of the piece. Cannon weighing more than 100 tons have seldom been constructed. The 100 ton gun is charged with 240 pounds of powder, and discharges a bolt of steel or chilled iron weighing 2,000 pounds. Cannon of the smaller calibers are mounted on wheeled carriages for service as field pieces. In the United States army the guns in service are 8, 10, 12, 15, and 20-inch smooth bore Rodman guns, and 3.2, 3.6, 5, 6, 8, 10, 12 inch breech loading rifled guns. It is proposed to build breech loading, rifled, coast defense guns of 16 inch caliber. The 3.2 inch gun is a steel field-piece. In the United States navy, 6, 8, 10, 12, and 15 inch steel guns have been adopted for ships of recent design. The principal parts of a cannon are 1st, the *breech*, which is the mass of metal behind the bottom or end of the bore, and extending to the base ring, 2d, in muzzle loading cannon, the *cascabel*, a projection in rear of the base ring, including the *knob*, the spherical part between the knob and the base ring being called the *base of the breech*, 3d, the *reinforce*, the thickest part of the cylinder, extending from the base ring forward 4th, the *trunnions*, which project on each side and serve to support the cannon, 5th, the *bore* or *caliber*, the interior of the cylinder, wherein the powder and shot are lodged, and which may be smooth or rifled, though rifled cannons have virtually superseded the smooth bores, 6th, the *muzzle* or *mouth* of the bore, 7th, in modern breech loading ordnance, the *breech plug* with its mechanism. Cannon are often made so as to be loaded at the breech, various devices being employed to effect this object. Cannon were formerly classed as whole cannons, demi-cannons, culverins, sakers, etc., but are now classed as guns, howitzers, carronades, and mortars, also as field, mountain, coast, sea, and siege guns. See *gun*.

2 In *mach*, a hollow cylindrical piece through which a revolving shaft passes, and which may revolve independently, and with a greater or less speed than that of the shaft. Such, for example, is the prolongation of the eye of a wheel when bored to fit a spindle or shaft on which it is intended to work loose, as the part *a* of the wheel *A*, loose on the shaft *b*.

3 That part of a bit let into the horse's mouth. Also *canon*, *cannon-bit*, *canon-bit* — 4 The canon-bone — 5 The ear or loop of a bell by which it is suspended. Also spelled *canon*.

The former, in the fore leg, extends from the carpus or so-called "knee" to the fetlock joint, and the latter, in the hind leg, from the tarsus or "hock" to the fetlock joint. In a solid ungulate, as the horse, the cannon bone is the single (third) metacarpal or metatarsal, in cloven footed quadrupeds as the ox, it is composed of two metacarpals or metatarsals fused in one. The rudimentary or incomplete lateral metacarpals or metatarsals on either side of the cannon bone, are called *spiral bones*. The cannon bone represents the extent of the limb from the carpus or tarsus to the articulation of the metacarpal or metatarsophalangeal articulation. Also spelled *canon bone*.

The canoes of sav age races are constructed of bark (as the birch bark canoe of the American Indians) or hides, or formed of the trunks of trees, excavated by burning or cutting them into a suitable shape. The birch bark canoe is light and can be carried on the shoulders, one large enough for four per-

sons sometimes weighing no more than 40 or 50 pounds. The modern canoe, employed chiefly for pleasure, is a light boat, carved or plank-built, sharp at both ends and with a beam one eighth or one sixth its length, it is usually

(b) In *liturgies*, that part of the liturgy or mass which includes the consecration, great oblation, and great intercession. It begins after the Sanctus (in the Roman liturgy, and other Latin liturgies influenced by the Roman, with the words *Te igitur*), and ends just before the Lord's Prayer, sometimes counted a

part of it. The Roman canon is divided into ten portions or paragraphs, generally named from their initial words. See *liturgy*.

**3.** The books of the Holy Scripture accepted by the Christian church as containing an authoritative rule of religious faith and practice. With the exception of the books called *apocrypha*, the canon of which was not at first universally recognized, the canon of the New Testament has always consisted of the same books. The books comprised in the Hebrew Bible, and constituting the Hebrew canon, that is to say, the books of the Old Testament as given in the authorized version from Genesis to Malachi inclusive, are universally recognized as canonical. The canonical character of the books not found in the Hebrew, but contained in the Septuagint or Vulgate, was disputed by many in the early church, and although they are received without distinction by the Greek Church, and, with the exception of some among the number, by the Roman Catholic Church, they are not accounted canonical by the Anglican Church (which, however, treats them as *ecclesiastical books*, that is, books to be read in the church), nor by any of the Protestant churches. See *apocrypha*, 2, *deuterocanonical*, and *ecclesiastical*.

**4.** The rules of a religious order, or of persons devoted to a strictly religious life, as monks and nuns; also, the book in which such rules are written.—**5.** A catalogue or list; specifically, the catalogue of members of the chapter of a cathedral or collegiate church.—**6.** A catalogue of saints acknowledged and canonized, as in the Roman Catholic and Eastern churches.

**7.** In *art*, a rule or system of measures of such a character that, the dimensions of one of the parts being given, those of the whole may be deduced, and vice versa. A canon is established, for instance, when it is shown that the length of any well-proportioned figure is a certain number of times that of the head taken as a unit, and that the length of the head is contained a certain number of times in the torso or the legs.

**8.** In *music*, a kind of fugal composition in two or more parts, constructed according to the strict rules of imitation. One voice or instrument begins a melody, and after a few beats, the number depending upon the character of the melody, a second takes up the same melody at the beginning, at the same pitch or at some definite interval, and repeats it note for note, and generally in turn for interval. The principle of the canon is that the second voice or instrument, when it begins the melody, must combine continuously, according to the strict rules of harmony, with that part at which the first voice has arrived, and when the third voice begins it must combine in the same manner with those parts at which the other two have arrived, and so on for any number of voices. A *round* is sometimes improperly called a canon.

Here we had a variety of brave Italian and Spanish songs, and a canon for eight voices, which Mr. Lock had lately made on these words: "Domine saluum fac Regem!" *Pepys, Diary, I. 26*

**9.** In *math*. (a) A general rule for the solution of cases of similar nature. (b) An extensible table or set of tables. (c) A collection of formulas.—**10.** In *logic*, a fundamental and invariable maxim, such as, Nothing ought to be done without a reason.—**11.** In the *Kantian philosophy*, the science which determines the right use of any faculty of cognition as pure logic is the canon of the formal use of the understanding and reason, transcendental analytics is the canon of the use of the understanding a priori, and so on.—**12.** In *phar.*, a rule for compounding medicines.—**13.** In *Gr. hymnology*, a hymn consisting normally of a succession of nine odes, but usually of eight (sometimes of only three or four), the second being omitted, except in Lent, the numbers of the third, fourth, etc., however, remaining unaltered. See *ode*, *tetradion*, *triodion*.—**14.** Annual charge for use of land; rent; a quit-rent.—**15.** In *printing*, a large text printing-type, in size about 17½ lines to the linear foot, so called from its early employment in printing the canon of the mass and the service-books of the church.—**Angerene canons.** See *Angerene*.—**Apostolic canons.** See *apostolic*.—**Boole's canon.** In *math*, a certain rule according to which a differential equation can be integrated if certain sufficient but not necessary conditions are fulfilled.—**Canon canons.** See *canonization*.—**Canon law.** rules or laws relating to faith, morals, and discipline, enjoined on the members of any church communion by its lawful ecclesiastical authority, specifically, a collection of rules of ecclesiastical order and discipline embodied in the Corpus Juris Canonici (body of canon law). It is a compilation from the canons of councils, the decrees of the popes and fathers, and the decretals and canonical replies made to questions put at various times to the Roman pontiffs. The principal parts of which it consists are the Decretum, or collection of decrees made by Gratian A. D. 1151, and the decretals of Gregory IX, to which are added the decretals of Boniface VIII, the Clementine constitutions, and the books called the *Extravagantes* of John XXII and the *Extravagantes Communes*. The canon law of the Church of England consists of canons passed in national and provincial synods and foreign canons adopted by custom and common law. In the Roman Catholic Church in England and elsewhere canons were formerly divided into three classes, *regular*, *secular*, and *honorary*. The *regular canons* lived in monasteries, and added the profession of vows to their other duties. *Secular* or *lay canons* did not live in monasteries, but they kept the canonical hours. *Honorary canons* were not obliged to keep the hours. The name *foreign canon* was given to such as did not officiate in their canons opposed to *monastery* or *residential canons*. Canons of the English cathedrals must be in residence for three months each year. Collectively, with the dean at their head, they form the chapter. There are also canons of a lower grade, called *minor canons*, who assist in performing the daily choral service in the cathedral. *Honorary canons* may also be appointed, but receive no emolument.*

*canonization* (kan'on-i-zā'shon), *n.* [= *F. canonisation*, < *ML. canonizare*, canonize see *canonize*] In the *Rom. Cath. Ch.*, the act of enrolling a beatified person among the saints. See *beatification*. Originally each bishop was accustomed to declare that particular deceased persons should be regarded as saints, but the exercise of this power was gradually assumed by the popes, who since 1170 have exercised the exclusive right of canonization. In order to canonization, it must be shown that two miracles have been wrought by the candidate before beatification, and two more after it by his intercession. The pope, on application, resumes the case of the beatified person, with the view of testing his qualifications for the higher rank which is claimed for him. A secret consistory is summoned at which three cardinals are appointed to inquire into the matter, who make their report at a second private meeting. In the third, which is a public consistory, one person called the *advocatus diaboli* or devil's advocate, attacks the person to be canonized, if doubts as to the miracles said to have been wrought by him and exposes any want of formality in the procedure, while another person, called *advocatus Dei*, or God's advocate, supports his claim. Lastly, a fourth consistory is held in which the votes of the prelates are taken for or against the canonization. If a plurality of votes are cast in favor of the candidate, the pope announces the day appointed for the ceremony which takes place at St. Peter's. Also spelled *canonisation*.

2. Receptivity, susceptibility to being passively affected in any way, power of receiving impressions, or of being acted upon.

Faculty is properly limited to active power and, therefore, is actively applied to the more passive affections of mind. Capacity on the other hand, is more properly limited to those. Its primary signification which is literally room for, as well as its employment, favors this although it cannot be denied that there are examples of its usage in an active sense. Leibnitz, as far as I know, was the first who limited its psychological application to the passivity of mind. The active [power] may be called faculty, and perhaps the passive might be called capacity, or receptivity.

Sir W Hamilton, Metaphysics, Bowen's Abridgment, viii

Capacity signifies greater passiveness or receptivity than [power or faculty]. Hence it is more usually applied to that in the soul by which it does or can suffer, or to dormant and latent possibilities to be aroused to exertions of strength or skill or to make striking advances through education and habit.

**capel**, **capel** (kā'pl), *n* [Origin unknown] In mining, a wall of a lode so called by Cornish miners, and chiefly when the country closely adjacent to the lode itself has been more or less altered by those chemical agencies under the influence of which the latter was formed. This alteration usually shows itself in a silification and hardening of the rock. The capels are sometimes themselves so impregnated with metalliferous particles as to be worth working, in such cases they are usually recognized as forming a part of the lode. If barren of ore, they are considered as belonging to the country. At the Mary Ann wheel (or mine) in Cornwall, and perhaps in other mines, the capel is called the **cab**, it is there described as consisting of chalcedonic quartz, and is considered as being a part of the lode, although barren of ore. The word is rarely heard outside of Cornwall. In the United States **caping** takes its place to some extent.

*H. Spencer, Prin. of Biol.*, § 12

5 Pertaining to the phenomena of the rise of fluids in tubes and chunks, and, more generally, to the collecting of liquids in drops,

their spreading over surfaces (as oil on water), and various other phenomena explicable proximately by surface-tension and ultimately by cohesion and adhesion, considered as forces acting at finite but insensible distances. — 6

In *surg.*, linear, descriptive of a fracture of the skull without separation of the parts of the injured bones. — **Capillary antennae**, in *entom.*, antennae in which the joints are long, slender, and very loosely articulated, the outer ones being generally a little longer, this is regarded as a modification of the clavate type. — **Capillary attraction, capillary repulsion**, the excess or deficiency of the attraction of one of two fluids (the other being generally air) for the wall of a vessel with which they have a common line of contact. The common surface of the wall and of the more attracted fluid makes the acute angle with the common surface of the fluids. Capillary attraction is proximately accounted for by surface tension, but the latter has to be explained by the attractions between the molecules of the fluids. See *capillary tubes*, below. — **Capillary bottle**, a bottle with a dropping tube, used in preparing objects for the microscope. — **Capillary bronchitis**. See *bronchitis*. — **Capillary electrometer**. See *electro-capillary*. — **Capillary filter**, a simple water filter, consisting of a cord of loose fiber, as a cotton candle wick, one end of which is placed in the water, while the other end hangs over the edge of the vessel. The water is drawn through the cord by capillary action, without its impurities. — **Capillary pyrites**, in *mineral*. See *millrite*. — **Capillary repulsion**. See *capillary attraction*, above. — **Capillary tubes**, tubes with very small bore, of which the diameter is only a half, a third, a fourth etc. of a line. If a tube of this sort, open at both ends, is taken and one of its ends immersed in water, the water will rise within the tube to a sensible height above the surface of the water in the vessel, the height being inversely as the diameter of the bore, that is, the smaller the bore the greater the height. Different liquids rise in capillary tubes to different heights. The rise is explained by the action of cohesion as a force acting at insensible distances (hence called *capillary attraction*), which produces a tension of the superficial film of the liquid (see *surface tension*) that exerts a pull upward where the surface is concave, as when the tube is moistened by the liquid (as glass or metal by water, alcohol, etc.), but a pressure downward where the surface is convex, consequently those liquids which do not adhere to or wet the surface of the tube immersed in them stand lower within than without. Mercury, for example, is depressed in a glass tube, but rises in one of tin, to which it can adhere. The oil rises in the wick of a lamp or candle by this principle. — **Capillary vessels**, in *anat.*, the capillaries.

**II. n**, pl *capillaries* (-riz) 1 A tube with a small bore. Specifically — 2 In *anat.* (a) One of the minute blood-vessels which form a network between the terminations of the arteries and the beginnings of the veins. The Capitol at Rome, situated on the southwestern summit of the Capitoline hill, was the center of the official religion of the state. In it the cult of Juno and of Minerva was associated with that of Jupiter. It was three times destroyed by fire, and each time restored with augmented magnificence; the last edifice continued to exist, though despoiled, till about the tenth century. The whole of the Capitoline hill (originally Mons Saturnius or Tarpeius) was also called the Capitol; on the second of its two summits was the citadel. The modern Capitol or museum of the Capitol, stands in the space between the summits. Meetings of the senate and other legislative bodies have been held in or on the Capitol in both ancient and modern times. Literary references or inscriptions prove the existence of a Capitol on the model of that in Rome in more than twenty provincial cities of Italy, Gaul, Spain, Africa, and the East, and there can be no doubt that a similar foundation was established in every regularly constituted Roman colony. The Roman Capitol of Toulouse, which has been more than once renewed, has been the chief seat of authority in that city from medieval times to the present day.

The cake bakers, being returned to Rome, went presently, before they did either eat or drink to the Capitol, and there before their king called Microcholo, made their complaint showing their panthers broken, their coats torn, etc.

It consists in suspending branches of the wild fig (see *caprify*) in the cultivated trees, and subjecting the fruit to the attacks of the gall insects which are thus introduced. The practice is one of great antiquity, but though still followed in many localities, is of very doubtful utility. Capriculation is also effected by planting an occasional wild fig among the others. In some portions of France the same object is attained by touching a drop of oil to

the orifice of the fruit, by which its ripening is hastened nearly a week.

—**Syn 1** *Prisoner, Captive* The word *prisoner* emphasizes the idea of restraint of liberty, but is not rhetorical or especially associated with fighting. The *prisoner* of war and the *prisoner* for crime may be shut up in a prison, kept by guards within defined limits, or given a restricted liberty on parole. The word *captive* suggests being completely in the power of another, whether confined or not. It has come to be a rhetorical word, suggesting helplessness and resulting unhappiness. *Captured* soldiers under guard are strictly *prisoners*, but are often and properly called *captives*. When we speak of a *captive* bird we suggest its longing for liberty. The rights and interests of a *prisoner* are likely to be respected, but the *captive* may be abused or even sometimes sold into slavery. See *captivity*

In this sense it has been used by most European ichthyologists since 1862. It includes fishes which have been distributed by others in the families Caranidae, Pomatomidae, Sciaenidae, *Zanclus*, *Cepoidea*, *Equulidae*, etc. (b) In Gill's system is restricted to *Scorpaenidae* with 10 abdominal and from 14 to 16 caudal vertebrae, a short or atrophied first dorsal fin, second dorsal and anal long, opposite and nearly alike, generally two small spines detached and forming a blunt and non-protractile jaw. These limits have been adopted by most recent American ichthyologists. It embraces numerous species of tropical fishes, the best known of which are the cavalier, pompano, and pilot fish.

The oil of the African species, *C Pondouensis*, called comeli kundah, or talik oona oil, is used by the negroes for making soap and anointing their bodies, its taste being so bitter that it serves as a defense against bites of vermin. It was generally the 24th part of a mark of gold and was subdivided into 12 grains. It was commonly equal to about 160 1/2 troy grains. Hence—3 A twenty-fourth part specifically used in expressing the fineness of gold when used as jewelry. Thus, pure gold being considered as 24 carats fine, if two, six, or ten twenty-fourths of alloy (commonly copper or silver) is present, the gold is said to be 22, 18, or 14 carats fine, and so on. The gold used by

jewelers is seldom over 18 carats fine, except in wedding-rings, the standard fineness of which is 22 carats. Gold of 18 carats fine is almost invariably used in mounting diamonds, while 14 carat gold is said to be ordinarily used in the United States for gold chains, etc.

4 A unit of weight for precious stones, divided by jewelers into 4 grains, called *diamond-grains*, but equal to about 3 1/2 troy grains, 151 1/2 English carats being taken as equal to an ounce troy. In 1877 the weight of the carat was fixed by a syndicate of London, Paris, and Amsterdam jewelers at 205 milligrams, or 151 76 carats to the troy ounce. Under the translated form *κερατος*, or *ceratium*, *silqua* was adopted by Constantine into the system of weights of the empire as 1/2 of an ounce, equal to 180 milligrams. In Italy it remained as a part of the system of weights, in general with the same relation to the ounce and with nearly the same value. The Arabic *qirat* was the 24th part of the *mithkal*, and was subdivided sometimes into 4, sometimes into 3 grains, its value for gems being very nearly 3 grains troy. The Castilian carat, 1/16 of a Castilian ounce, or 3 164 troy grains, was, like the rest of the Castilian system, adopted from the Arabs. From Spain this has passed to the rest of Europe and to America, with only small modifications, less than unlegalized units commonly in use, under the name of the *Amsterdam* or *diamond carat*, which is usually divided into 64ths. Pearls are sold by the diamond grain and not by the carat, while small baroque pearls, coral rough garnets, and the inferior kinds of stones are sold by the ounce troy. The subdivisions of the carat are always expressed in fourths, eighths, sixteenths, etc.

Often abbreviated *car* or *K*.

**carbolic** (kâr-bol'ik), *a.* [*< carb(on) + -ol + -ic*] Pertaining to or derived from carbon or coal. — **Carbolic acid**, a substance ( $\text{C}_6\text{H}_5\text{OH}$ ) found in that part of the heavy oil of coal tar which distills over between 320 and 374°. From this product of coal tar it is almost exclusively prepared. It has feeble acid properties, but in chemical structure is allied to the alcohols, and belongs to a class of compounds called *phenols*. When pure it crystallizes in white, colorless needles, which have the odor of cresote and a burning taste. They do liquefy readily and become liquid. It is an irritant poison when taken in large doses, but in doses of from 1 to 4 grains it is used internally as a therapeutic agent. Its chief medicinal use, however, is as a disinfectant in antiseptic surgery, and as an external application to unhealthy sores, compound fractures, ulcers, etc., after they have been opened, and tissues that are exposed as a result of surgical operations. The action of the acid is not only to exclude germs that induce putrefaction, but also to destroy such as may have been admitted, for which reason it is introduced into the interior of the wound. Also called *phenic acid*.

Chemical symbol, C, atomic weight, 12. An element found in nature in two distinct forms, the diamond, which is extremely hard, of high specific gravity (3.5), usually colorless and transparent, with brilliant adamantine luster, and crystallizes in octahedrons, and graphite, which is very soft, of low specific gravity (2), black and opaque, with metallic luster, and crystallizes in hexagonal plates. See *diamond* and *graphite*. Its physical properties vary greatly with its different forms. It is combustible burning to carbonic acid ( $\text{CO}_2$ ). In combination it is universally distributed through the animal and vegetable kingdoms being a constituent of every living tissue. By the action of heat on such tissues, with partial or complete exclusion of air, carbon is produced in amorphous form more or less mixed with other matters. Such products are animal charcoal, lampblack, wood charcoal, coke, and gas carbon. The number of its compounds with the other elements is endless, and at present more compounds of carbon are known, probably, than of all other elements taken together. It is present in the atmosphere as carbon dioxide or carbonic acid gas, and in the same form in some mineral waters. It also appears in the salts called carbonates, as calcium carbonate in coal in the shells of many sea animals, in the common mineral calcite, including chalk, limestone, marble, etc., and as iron carbonate in the mineral siderite, etc.

2. The form of the diamond generally called *carbonado*, the black diamond.—3. In *electric lighting*, a carbon-point (see below). — **Bisulphid of carbon**. See *bisulphid*. **Carbon dioxide**. Same as *carbonic acid* (which see, under *carbonic*). — **Carbon points**, in *electric lighting*, two rods of very hard, compact carbon, between which the electric arc is formed, producing a light of great brilliancy. See *voltaic arc*, *under arc*, and *electric light*, under *electric*. — **Carbon process**, in *photography*, a process of producing photographic positive pictures in a pigment composed of carbon, in order to insure their permanency. The thin paper on which the impression from the negative is taken is coated with gelatin colored with the carbon pigment, and sensitized, usually with bicarbonate of potash. After exposure to light under the negative it is affixed face downward upon another sheet of paper and is plunged with it into a hot water bath, which detaches the first paper and leaves the gelatin film uncovered. The water dissolves those portions of the film which have not been rendered insoluble by the action of light through the transparent portions of the negative upon the sensitizing medium, and the more or less insoluble portions of the film form a positive picture, which is, however, reversed in its relations of light and left. If a second transfer of the film from its support, to restore the original relations in the finished print, is required the first transfer is not made to a paper surface but to a sheet of glass, zinc, or caoutchouc. The same end may be accomplished without the second transfer, by stripping the negative film from the glass, and printing with its face outward, by reversing the right and left of the negative by the use of a prism, or by other de-

It forms an iron gray deposit on the sides and upper part of the retort. It is extremely hard, and is a good conductor of heat and electricity. It is used in the preparation of carbon battery plates, and also for the carbon points used with the electric arc light. Also called *coal gas charcoal* and *gas graphite*.

**carbena** (kär'bo-nä), *n* [NL. see *carbon*] In *mining*, a mass of stamiferous rock, irregular in form, and not possessing the general character of a lode. Such a mass, however, is ordinarily subordinate to a lode in its immediate vicinity. The carbena is in some respects analogous to the pipes and "flats" of the North of England lead mines. The carbena of the St. Ives lode in Cornwall, England, was one of the most remarkable of these occurrences, and one of the first to which this name was given. It was composed of feldspar, quartz, black tourmaline (schorl), tin ore (cassiterite), and some cuprifera. It also contained fluor spar, which was not present in the lode itself.

**Carbonaro** (kär-bo-nā'ro), *n*, *pl* *Carbonari* (-rī) [*It. lit. (as carbonaro), a charcoal-burner, < L. carbonarius, a charcoal-burner, a collier, < carbo(n-) > It. carbone, coal, charcoal, see carbon*] One of the members of a secret political society called the Carbonari, formed in the kingdom of Naples during the reign of Murat (1808-14) by republicans and others dissatisfied with the French rule. They were originally refugees among the mountains of the Abruzzi provinces and took their name from the mountain charcoal burners. Their aim was to free the country from foreign domination. After having aided the Bonapartes in the expulsion of the French, the organization spread over all Italy as the champions of the national liberal cause against the reactionary governments. At one time the Carbonari numbered several hundred thousand adherents. They were crushed in the various revolutions of the times until they spread into France, and played an important part in French politics until the revolution of 1848.

Louis Napoleon began as a Carbonaro and conspirator, and narrowly escaped the fate which terminated the course of his elder brother and removed at least one rival out of his way.

This is an important class of ores in Colorado and Utah. — 3 Same as *carbonado* or *bon*. Also *carbonatation*.

**carbon-black** (kär'bo-nā-blak), *n* A fine lamp-black used in making printing-inks and paints. It is made by directing the flames of gas lamps, fed by natural gas from wells, against cold surfaces, and collecting by machinery the sooty deposit. It is almost pure carbon in a finely divided form.

**carbon-bronze** (kär'bo-nā-bronz), *n* An anti-friction alloy of which the principal constituent is copper. It was invented by Baldwin and Weisman, and is used for journal-bearings, etc.

**carbon-button** (kär'bo-nā-but'n), *n* A small disk of carbon, usually of compressed lampblack, used in a form of telephone invented by Edison. The resistance which it offers to the passage of an electric current depends upon the pressure to which it is subjected so that when it forms a part of a circuit of constant electromotive force the current strength will vary with variations of pressure on the disk. See *carbon telephone*, under *carbon*.

**carbonic** (kär'bo-nīk), *a* [= *F. carbonique = Sp. Pg. It. carbonico, < NL. carbonicus, < carbo(n-), carbon see carbon and -ic*] Pertaining to carbon, or obtained from it. — **Carbonic acid**, (CO<sub>2</sub>), more properly called *carbonic anhydride* or *carbon dioxide*, a gaseous compound of 12 parts by weight of carbon and 32 of oxygen, colorless, without smell, 2 1/2 times as heavy as hydrogen, and existing in the atmosphere to the extent of 1 volume in 2,600. It is reduced to a liquid by high pressure and cold, and it is obtained as a solid white substance by means of the intense cold produced by the sudden expansion of the liquid when allowed to escape from pressure. It has a pungent, acidulous, pungent taste, and acidates beverages of all kinds—beer, champagne, and carbonated mineral water—in part owing their refreshing qualities to its presence, for, though poisonous when taken into the lungs, it is harmless when taken into the stomach in moderate quantity. Dissolved in water it forms a dibasic acid, (CO<sub>2</sub>H)<sub>2</sub>, whose salts, the carbonates, are widely and abundantly distributed in nature. It is incapable of maintaining combustion or animal life, as it is a narcotic poison when present in the air to the extent of only 1 or 5 per cent. It is discharged from fermenting liquors and from decomposing vegetable and animal substances, and is largely evolved from fissures in the earth, constituting the choke damp of mines. From its weight it has a tendency to subside into low places, valleys, and wells, rendering some low lying places as the upper valley of Java, and many caves, uninhabitable. This gas is formed and given out during the respiration of animals, and in all ordinary combustion from the oxidation of carbon in the fuel. It is evolved from the colored parts of the flowers of plants both by night and day, and from the green parts of plants during the night. In direct or diffuse daylight, plants absorb it energetically from the atmosphere through their leaves, and decompose it, assimilating the carbon, and returning most of the oxygen to the air. **Carbonic acid engine** (a) A fire engine from which water is ejected by the pressure of carbonic acid gas, which is evolved in a chamber connected with the water reservoir. (b) An engine which is moved by the expansive force of condensed carbonic acid. — **Carbonic acid water** See *carbonated water*, under *carbon*. — **Carbonic or carbonous acid**, a substance (CO) obtained by allowing carbonic acid to pass over red hot fragments of charcoal, contained in a tube of iron and porcelain, and also by several other processes. It is a colorless, inodorous gas, a little lighter than air, has neither acid nor alkaline properties, is very poisonous, and burns with a pale lavender flame. This substance is produced when a coal fire burns with a smokeless flame and the pale lavender flame produced by its combustion may often be observed playing over such a fire.

**Carbonides** (kär'bo-nīdē), *n* *pl* [NL., < *Carbo(n-)* + *-ide*] A name of the eormorant family.

**Carboniferous** (kär-bo-nīf'ē-rūs), *a*. [*< L. carbo(n-), coal, & ferre = E. bear*], Containing or yielding carbon or coal. In *geol.* almost exclusively used in designating that assemblage of strata from which the coal of England, France, Germany, and the United States is for the most part obtained. The carboniferous series is of the Paleozoic age, and is the most recent portion of the Paleozoic. It is overlaid by the Permian rocks, which belong to the closing era of the Carboniferous age, and is underlaid by the Devonian. The Carboniferous, over large areas both in Europe and North Amer-

ica, is separable into three more or less distinct groups: the coal measures, the millstone-grit, and the mountain limestone. The first of these three is a series of shales and clays, with which the coal beds themselves are interstratified. This part of the series is sometimes several thousand feet in thickness, and the number and thickness of the intercalated coal beds differ greatly in different regions. The millstone-grit is a detrital rock ordinarily quite silicious, and assuming all degrees of fineness, from that of a fine grained gritstone to that of a coarse conglomerate. Its thickness varies greatly in various regions. The mountain limestone is a calcareous rock, often rich in fossils of marine origin, and sometimes having a thickness of over 3,000 feet. See *coal*, *coal measures*, *millstone grit*, and *mountain limestone* (under *limestone*). [In technical use, commonly with a capital.]

**car-brake** (kär'brāk), *n*. A brake used to arrest the motion of a railroad-car. When operated by hand, it comprises a brake wheel, brake shaft, brake-chain, brake lever, and brake shoe, with their various parts. (See *brake-shaft*, *brake-shoe*, and *brake-wheel*.) Where other than hand power is used, the brake consists essentially of the shoe and lever and some means (as a coiled spring, steam, compressed air, or the pressure of the air acting in a vacuum) for developing power and applying it to operate the brake lever. When all the brakes of a train are operated together by a single application of power, the apparatus is called a *continuous brake*. The most important forms of such brakes are the Westinghouse brake and the vacuum brake. (See *air brake*.) Air carburetors are of this last class. Various devices are employed to saturate the air with the vapor, but all are essentially alike.

A carcinoma is characterized microscopically by trabeculae and nodular masses of cells of epithelial form and origin, running in a stroma of tissue of mesoblastic origin. Several types are distinguished: (1) flat (called epithelioma), (2) cylindrical epithelioma, (3) simple carcinoma (carcinoma simplex), a variety of glandular carcinoma forming nodular tumors of considerable consistency, (4) carcinoma scirrhosum, or scirrhous cancer, a variety forming very hard nodules of almost the consistency of cartilage, (5) carcinoma gelatinosum, or cancer with colloid degeneration of the epithelial parts, (6) carcinoma myxomatodes, or cancer with the stroma consisting of mucous tissue, (7) cylindroma carcinomatodes, (8) carcinoma giganteocellular, (9) melanocarcinoma. Certain pathologists exclude the epithelioma from the carcinomata, and hold that the latter are not of epithelial origin, but are purely mesoblastic formations. Some, again, founding the definition of carcinomata entirely on anatomical features, independently of histogenetic considerations, include in them the sarcomatous alveolaria. The softer carcinomata are as a rule the more rapidly fatal. The earlier a cancer is removed, the greater is the prolongation of life and the chance of escaping a return. **carding-machine** (kär'ding-ma-shén'), *n.* A machine for carding fibers of wool, flax, or cotton, preparatory to drawing and spinning. Carding machine

A main cylinder, B / C, G toothed rollers / bearings A, roller, toothed drum or doffer

strips by hand as they became full. In modern cotton carding machines a loose roll of fibers, called a *lap*, is placed in guides and rests upon a roller, which as it revolves unwinds the lap and delivers it to the *feed roll*, on passing through which it is seized by the card teeth upon a small cylinder, called the *feeder*, from which it is drawn by the teeth of the clothing of the main cylinder. Other small cylinders successively remove the fibers from and deliver them to the main cylinder. The tufts, tangles, or knots which are not loosened by the action of these cylinders project beyond the teeth of the main cylinder, and are caught by the teeth of a succession of wooden slate called *card tops*, *top-cards*, or *top flats*, from which they are cleared or stripped by hand or by mechanical devices. The fibers upon the main cylinder are laid parallel upon it, and are removed by means of the *doffer*, a cylinder moving in an opposite direction from the main cylinder and at a very much slower rate, and whose whole surface is covered by card clothing. The cotton is stripped from the doffer in a thin continuous sheet of its full width, by means of a comb vibrating vertically in contact with the teeth of the doffer. This sheet of fibers is drawn to gether into a ribbon, traverses a funnel or trumpet, and is passed between successive pairs of rolls, which draw out and condense the silver, and finally deliver it into the can ready for the *drawing frame*, where it is doubled and drawn preparatory to twisting or spinning. For fine work, the operation of carding is repeated. The preparatory card or cards are called *breakers*, and those machines on which the carding is completed are called *finishers*. The principle of the wool carding machine is identical with that of the cotton carding machine, and it is chiefly distinguished from the latter by a great number of small cylinders called *urcers*, which work in pairs and are called *workers* and *cleansers*. The worker is the larger of the two, it strips the wool from the large main cylinder, and is itself cleaned by the smaller cylinder or cleanser, which delivers the wool back to the main cylinder, when it is again seized by the next worker. Wool fibers are oiled to facilitate carding and to prevent felting

**Extraordinary care, ordinary care** See the adjectives — **Take care**, be careful, beware — **To have a care** See *have* — **To have the care of**, to have charge of = *Syn*. *Care*, *Concern*, *Solicitude*, *Anxiety* Care is the widest in its range of meaning. It may be with or without feeling, with or without action as, the care of a garden. In its strongest sense, care is a painful burden of thought, perhaps from a multiplicity and constant pressure of things to be attended to as, the child was a great care to her. *Concern* and *solicitude* are a step higher in intensity. *Concern* is often a regret for painful facts. *Care* and *concern* may represent the object of the thought and feeling, the others represent only the mental state as, it shall be my chief concern. *Solicitude* is sometimes tenderer than concern, or is attended with more manifestation of feeling. *Anxiety* is the strongest of the four words, it is a restless dread of some evil. As compared with *solicitude*, it is more negative as, *solicitude* to obtain preferment, to help a friend, *anxiety* to avoid an evil. We speak of care for an aged parent, concern for her comfort, *solicitude* to leave nothing undone for her welfare, *anxiety* as to the effect of an exposure to cold (for apprehension and higher degrees of fear, see *alarm*)

—**Syn.** *Caricature*, *Burlesque*, *Parody*, *Travesty*. The distinguishing mark of a caricature is that it absurdly exaggerates that which is characteristic, it may be by picture or by language. In a parody the characters are changed, while in a travesty they are retained, only the language being made absurd (*See Travesty*). In a burlesque of a literary work the characters are generally changed into others which ludicrously suggest the originals.

A mendicant friar of the order of Our Lady of Mount Carmel.

This mountain, overlooking the bay of Acre in northwestern Palestine, has been from early times a resort for hermits, and in 1168 Berthold, a Calabrian monk, in obedience to a professed revelation from the prophet Elijah, built there a tower and a church and gathered around him about ten companions. From this small beginning arose the Carmelite order. According to an early rule, the monks were to live in separate cells, to abstain from meat, and to observe a strict fast from the Exaltation of the Cross (Sept. 14th) to Easter, Sundays being excepted. Owing to Mohammedan persecutions, the Carmelites abandoned Mount Carmel and established themselves in 1238 in Cyprus and elsewhere. In the sixteenth century St. Theresa, a Spanish lady of noble family, built a convent at Avila and established a discolored or reformed branch of the order, consisting of both monks and nuns, sometimes called *barefooted Carmelites*. The habit of the order is a cassock, scapular, and hood of brown color, and a white cloak, the hood covering the head and face and having holes for the eyes. In the United States there are convents of the order in the dioceses of Leavenworth, Newark, Pittsburgh, Baltimore, St. Louis, and New Orleans. The three convents last named follow the rule of St. Theresa.

disorder, and noise. A *carousal* is by derivation a time of drinking deeply. It may be a bacchanalian feast, a noisy, unrestrained drinking bout. *Wassail* is limited by its associations with the past so as to be chiefly poetic or to express deep drinking. *Spree* is considered a colloquial word, but seems likely to win recognition as a convenient word for a period of drunkenness which incites to wild and reckless action. *Debauch* is distinctively excess, having less reference now than formerly to eating, applying chiefly to gross lewdness or drunkenness, which is often prolonged. *Saturnalia*, like *wassail*, has historical associations, it is a strong word for license, noisy revelry, gross and continued debauchery. *Orgy* is by derivation a secret nocturnal debauch, and by usage a time of joining in a wild or frantic abandonment to drunkenness or lust, or both—the extreme in that kind of misconduct. See *Feast*.

O that men should put an enemy in their mouths to steal away their brains! that we should with joy, pleasance, revel, and applause, transform ourselves into beasts!

The normal form has a long compressed body, large scales (95 to 300 along the lateral line), a long dorsal with a strong serrate spine and 17 to 22 rays, a short anal with 3 simple and 5 branched rays, and 4 barbels upon the upper jaw. It is said to have been introduced into England in the fourteenth century. It is an excellent fish for ponds, as it breeds rapidly, grows to a large size, sometimes attaining the length of 4 feet, and lives for many years. In old age its scales become gray and white. There are numerous varieties, the most notable being (a) the normal form of *scale carp*, just described, (b) the *mirror carp*, distinguished by very large scales below the dorsal,

piece, like the Persian carpet) was also used (as it still is in the East) for covering beds, couches, tables, etc., and for hangings (see *tapestry*). The first woven carpets were produced in Egypt, Babylonia, Persia, and Hindustan, whence they were introduced into Europe, where they are supposed to have been first manufactured by the French in the reign of Henry IV, and next in England, at Mortlake in Surrey, in the reign of James I. The smaller carpets of the East are now commonly called *rugs*. See *rug*.

In the ordinary Brussels carpet both the pattern and the ground are left with the loops uncut, in the Imperial Brussels carpet the pattern is raised above the ground, and its loops are cut so as to form a pile, those of the ground being uncut. - **Chenille carpet**, a carpet in which the weft is of chenille instead of yarn. The pattern is dyed in the chenille itself, nothing showing at the surface of the carpet but the ends of the chenille fringe. - **Felt carpet**, a carpet in which the fibers are matted or felted together without spinning or weaving. - **Ingrain carpet**, a carpet made of wool dyed in the grain, or before it is manufactured. It is called *Scotch* or (in England) *Kilminster*, from the place where it is made, and *two ply* or *three ply*, according to the number of wefts composing the fabric. - **Paper carpet**, a floor covering (plain or in imitation of ornamental woods) made of a hard and tonaceous paper called *heaven*, which is made by subjecting the paper pulp to the action of chlorid of zinc and then to strong pressure, by which means the product is rendered hard and tough like leather. - **Persian carpet**, a carpet made in one piece, instead of in breadths or strips to be joined. The warp and weft are of linen or hemp, and the tufts of colored wool are inserted by twisting them around the warp all along the row according to the wearer's taste, no pattern being used. A line of tufts being inserted, a shoot of the weft is made, and the tufts beaten up to close the fabric. - **Pile carpet**, a carpet made in the same way as Brussels carpet, but having its loops cut, thus forming a pile or soft surface. - **Printed carpet**, a carpet dyed or printed in colors, it is either woven in undyed colors and printed like calico, or the yarn is dyed in sections, which are adjusted according to their future position in the fabric. - **Scotch carpet**. Same as *ingrain carpet*. - **To be on the carpet** (more commonly on the *tapis* see below), literally, to be on the table cloth or table, as for consideration, hence, to be under discussion, be the subject of deliberation or of intended action. a translation of the French phrase *être sur le tapis* (*tapis*, table cloth, carpet, etc. see *tapestry*). - **Turkish or Turkey carpet**, a carpet similar to the Persian, distinguished by the selection of the tufts of colored wool according to the pattern followed, and the manner of their attachment to the back. The cutting of the yarn gives it the appearance of velvet. - **Venetian carpet**, a carpet with a warp or chain of worsted, generally arranged in different colored stripes. - **Wilton carpet**, a variety of Brussels carpet in which the loops are cut open into an elastic velvet pile so named from being made originally at Wilton in England.

One who carries not as a business, but only on occasion by special agreement, is termed a private or special carrier. One who holds himself out as a carrier, inviting the employment of the public generally is a common carrier. He is bound to serve without favoritism all who desire to employ him, and is liable for the safety of goods entrusted to him, except by losses from the act of God or from public enemies, or unless special exemption has been agreed upon, and in respect to the safety of passengers carried he is liable for injuries which he

might have prevented by special care. The most familiar classes of common carriers are railroad companies, stage-coach proprietors, expressmen, truckmen, ship owners, steamboat lines, lightermen, and ferrymen. The special rules of liability which the law, for reasons of public policy, imposes on common carriers have not been applied in their full extent to the business of drovers, owners of tow boats, log drivers, and others who do not literally carry the property entrusted to them, nor are telegraph companies deemed common carriers in respect to the messages they transmit.

**Cartesian** (kär-té'shan), *a* and *n* [*F* *Cartésien* = *Sp. Pg. It. Cartesiano*, < *Cartesius*, Latinized form of *Cartes* in the name *Descartes* (*Des Cartes*), of which the first element is a removable prefix] 1. *a* Pertaining to the French philosopher René Descartes (1596-1650), to his philosophy, or to his geometrical method. In order to put philosophy on a sound basis, Descartes proposed to begin by doubting all things. But the doubt he thought, could not be doubted. Hence the fundamental proposition of his philosophy, *Cogito, ergo sum* (I think therefore I am). This proposition (which is not a syllogism nor any formal mode of inference) means that, recognizing the fact that I think, I am irresistibly led to believe, and clearly to discern that I exist, with out being able to account for the inference. According to Descartes the consideration that the conception of a deity involves the conception of a reality surpassing my own leads to the irresistible belief and clear perception of the existence of a God. Also, since veracity is an attribute of God, all that is clearly and distinctly apprehended must be true. This is the so-called *Cartesian criterion of truth*. Substances he taught, are of two radically different kinds, the *material* which are extended and not conscious, and the *spiritual*, which are conscious and not extended—a doctrine which is called *Cartesian dualism*. The *Cartesian doctrine of divine assistance, or occasionalism*, which was not fully developed by Descartes himself, is that whenever the soul makes a voli-

tion God intervenes to cause the corresponding motion of the body. He also taught that brutes are mere machines without consciousness (the *Cartesian automaton*), and that all space is filled with matter, which turns about in vortices, and so produces the motions of the heavenly bodies. — **Cartesian coordinates**, in *geom.*, the lines introduced (1637) by René Descartes for defining the positions of points in a plane. Two straight lines, *OX* and *OY*, are adopted arbitrarily as *axes of coordinates*, to which all positions are referred. Their point of intersection, *O*, is called the *origin of coordinates*. From any point, *P*, whose position is to be defined, a line, *MP*, is drawn parallel to *OY*, and meeting the axis *OX* in *M*. The length *OM*, or the *abscissa*, being given, the position of *P* is determined, these lines are called the *Cartesian coordinates of the point P*. The term is sometimes extended to a similar system for three dimensions. — **Cartesian curve**.

It consists of a hollow figure, usually in the faunted form of a demon, with a hole at some distance from the top. The figure is filled with air in the upper part and with water in the lower, and floats in a tall glass vessel nearly full of water and covered air tight with india rubber or a piece of bladder. When this cover is pressed down, the air underneath is compressed and water enters the figure by the hole so as to bring the air with in the figure to an equal degree of compression. The figure consequently sinks, and does not rise again until the pressure is removed. — **Cartesian geometry**, geometry treated by means of coordinates, analytical geometry. See *Cartesian coordinates*, above. — **Cartesian lens**, a lens so shaped that there is no spherical aberration, especially, a concavoconvex lens having one surface spherical and the other ellipsoidal. Such lenses were proposed by Descartes, but never successfully executed, and were shown later to be needless. — **Cartesian measure of force**, the measure of force as proportional to the velocity, founded on the observation that the same force is required to raise one pound two feet as to raise two pounds one foot. Owing to the confused notions of force of Descartes and his followers, it is impossible to say whether the principle as enunciated by them is correct or not, but its errors appear, at any rate, to have been corrected in the final development of the doctrine, though it is now superseded.

*E B Tylor, Prim Culture, I. 114*

In art, a design of the same size as an intended decoration or pattern to be executed in fresco, mosaic, or tapestry, and transferred from the strong paper on which it is usually drawn either by cutting out the figure and outlining it on the surface to be decorated with a sharp point, or, in the case of a composition, by pricking, and pouncing with a bag of muslin filled with charcoal-dust. Colored cartoons intended to be woven in tapestry are cut in strips, placed under the web, and exactly copied by the weaver, the seven by Raphael purchased by Charles I. of England, are well known examples. 2. An oval or oblong figure on ancient Egyptian monuments and in papyri, containing groups of characters expressing the names or titles of royal personages and, rarely, of deities: a name given by Champollion. By extension it now commonly signifies both the inclosing ring and its contents. From a very early date, if not from the beginning, an Egyptian king at the moment of

coronation assumed, in addition to his family or personal name, an official, regal, or throne name, which took its place beside the former, generally preceding it, and thus gave occasion to a double cartouche. In imitation of the German *schilde* employed in a heraldic sense, the cartouche is in English sometimes styled a *shield* or *escutcheon*, or more often merely an oval.

Cartouche of Cleopatra

Cartouche of Ramesses II

Two names in an oblong inclosure called a *cartouche*.  
*S. Sharpe, Illust. Egypt.*

An elliptical curve or oval inclosing a name, always signified that the inclosed name was that of a king or queen, and Champollion gave it the name of *cartouche*, by which it is now called.

Italian escutcheons are often egg shaped, but the shield designated by the word *cartouche* has both ends equally curved, and therefore approximates to an ellipse.

**cartouset**, *n*. A variant of *cartouche*. *Bailey, 1731.*

**cartridge** (kär'trij), *n*. [Formerly *cartrage*, a corruption of *cartouche*, *q v*] A case of pasteboard, parchment, copper, tin, serge, or other material, holding the exact charge of gunpowder, in the case of big guns, and of powder and bullet or shot for other firearms. — **Blank cartridge**, a cartridge without ball or shot. — **Blasting cartridge**. **car-truck** (kär'truk), *n*. The wheeled carriage which supports a railroad-car. In Europe the pedestals for the axle boxes are commonly attached to the body of the car. In the United States the car body is supported upon two independent trucks placed beneath it. Each of these may have two, but usually four, and occasionally six wheels fixed upon revolving axles, whose journal boxes vibrate vertically in pedestals secured to the framework of the truck. The bolsters or cross beam which directly supports the car body is in the middle of the truck work, and is suspended from it by equalizing bars and suspension straps, in such a way as to distribute the weight upon all the wheels and allow for the sway, or freedom of motion, essential to easy riding. Springs and brake mechanism are attached to the truck.

—Side bearings of a car-truck. See *bearing*.

**cart-saddle** (kürt'sad'l), *n*. The small saddle put upon the back of a draft-horse when harnessed.

**caruagat**, *n*. [Also misread and miswritten *caruagat*, but the *u* is prop a vowel see *carue*] Same as *caruagat*.

**caruca**, *caruca* (ka-rü'kä), *n*. [*ML*, a plow, *L caruca*, a four-wheeled carriage, < *carrus*, a car see *car*<sup>1</sup>. Cf *carue*.] In ancient village communities in England—(a) A plow. (b) A plow-team of oxen, yoked four abreast.

Information from the same source [Statistical Account of Scotland] also explains the use of the word *caruca* for plough. For the construction of the word involves not 4 yoke of oxen but 4 oxen yoked abreast, as are the horses in the *caruca* so often seen upon Roman coins. And the "statistical account" informs us that in some districts of Scotland in former times "the ploughs were drawn by 4 oxen or horses yoked abreast one trod constantly upon the tilled surface, another went in the furrow, and two upon the stubble, or white land. The driver walked backwards holding his cattle by halters, and taking care that each beast had its equal share in the draught."

Seebohm, Eng VII Community, p 68.

**caruagat**, *caruagat* (kär'ü-kä), *n*. [*ML caruagum* (for *\*caruaticum*), also *carruagum* (after *OF carruage*), < *carruca*, a plow see *caruca*.] 1 The act of plowing—2. A former tax on land or landholders, fixed at a specified sum on each carucate, or about 100 acres of land. It succeeded the Danegeld (which see).

The other remarkable matter of the year 1198 is the imposition of a *caruagat*—a tax of five shillings on each carucate or hundred acres of land.

Stubbs, Const Hist, § 160.

Also formerly *caruagat*.

**carucate**, *carucate* (kär'ü-kät), *n*. [*ML carucata*, *caruacata*, < *caruica*, a plow see *caruca*.] Formerly, as much land as could be cultivated by one caruca usually about 100 acres, but the quantity varied according to the nature of the soil and the practice of husbandry in different districts. Also *carue*.

A trace at least of the original reason of the varying contents and relations of the hide and virgate is to be

found in the Hundred Rolls, as, indeed, almost everywhere else, in the use of another word in the place of hide, when, instead of the anciently assessed hideage of a manor, its more modern actual taxable value is examined into and expressed. This new word is *carucate*—the land of a plough or plough team.

Seebohm, Eng VII Community, p 40.

**carue** (kär'ü), *n*. [Later misread and miswritten *carue*, < *ME carue*, < *OF carue*, *caruee*, < *ML carucata*, *carrucata*, a certain portion of land see *carucate*.] A carucate (which see).

And a Carue of Land, Carucata terre, or a Hide of Land, Hida terre (which is all one), is not of any certain content, but as much as a Plough can plough in a Year, and there with agrees Lambard verbo Hyde. And a Carue of Land may contain an House, Wood, Meadow, and Pasture, because by them the Ploughman and the Beasts of the Plough are maintained.

Anthony Lowe's Case (1610), 9 Coke, 123, 124.

Side Elevation and Section of Passenger-car Truck

And it was agreed that common way be appendant to a Carue of Land, and so a Carue of Land consists of Land, Meadow, and Pasture, as it appears by Tiringham's case, 4 Coke, 57 b.

**Carum** (kä'rum), *n*. [*NL.*, < *Gr. káron*, caraway see *caraway*.] A considerable genus of plants, natural order *Umbelliferae*. The Manx have a literature—a native vernacular Gaelic literature. This literature consists of ballads on sacred subjects, which are called *carvals*. It was formerly the custom in the Isle of Man for the young people who thought themselves endowed with the poetic gift to compose carols some time before Christmas, and to recite them in the parish churches. Those pieces which were approved of by the clergy were subsequently chanted by their authors through their immediate neighbourhoods, both before and after the holy festival. Many of these songs have been handed down by writing to the present time. The *carvals* are preserved in uncouth looking, smoke-stained volumes, in low farm houses and cottages situated in mountain gills and glens.

Quoted in *Intro to Kelly's Manx Grammar*, (Mar, p xiv).

In this sense case is nearly synonymous with *cause*, which is the more technical term. Case includes special proceedings, as well as actions at law, suits in equity, and criminal prosecutions, and it implies not only a controversy, but also legal proceedings. More loosely, however, it is used for cause of action, as, he has a good case.

(b) The state of facts or the presentation of evidence on which a party to litigation relies for his success, whether as plaintiff or defendant, as, in cross-examining plaintiff's witness, defendant has no right to go beyond the limits of the direct examination, for such inquiries are part of his own case. (c) Under American procedure, a document prepared by the appellant on an appeal, containing the evidence, or the substance of it, and the proceedings on the trial in the court below. It is intended to enable the appellate court to review the evidence and the facts as well as to pass upon alleged errors of law, and in this differs from a *bill of exceptions*, which presents only alleged errors of law. Called specifically *case on appeal*.

6 In *gram*, in many languages, one of the forms having different offices in the sentence which together make up the inflection of a noun, as, the *nominative case*, that of the subject of the verb, as *he, dominus* (Latin); the *accusative* or *objective case*, as *him, dominum*, the *genitive* or *possessive case*, as *his* (John's), *domini*. These are the only cases in modern English, and the objective is not distinguished in form from the nominative except in a few pronouns. In addition to the three cases found in English, Greek and German have a dative, Latin has a dative, an ablative, and a vocative, and Sanskrit further an instrumental and a locative. The French has lost all case distinction in nouns. Some languages, as the Finnish and Hungarian, have many more cases, even fifteen or twenty. All the cases but the nominative are called *oblique cases*.

7. A person who is peculiar or remarkable in any respect, as, a queer case, a hard case sometimes used without qualification, as, he is a case [Colloq.]

"Well, the General can tell you," says the hunter, glancing at that individual, "what a terrible hard case I've been!"  
W. M. Baker, *New Timothy*, p. 114.

8. In *logic*, a proposition stating a fact coming under a general rule, a subsumption. — **Action on the case**, in *law*, a general form of action (the phrase being originally equivalent to *action on the circumstances*) adopted to enlarge the legal remedies at a time when forms of action existed for trespasses with violence and for debts resting in bond, but no form had been provided for wrongs without violence, such as negligence, or oral or implied promise. It became the most widely used of all common law forms, and equally applicable to consequential injury to the real or personal property and to the personal character of the party by whom it was brought. — **Amistad case**, a noted case in the courts of the United States, in which Spaniards claimed as their slaves negroes who had been kidnapped in Africa, and who while

being carried to Cuba (in 1839) rose against their captors, took possession of the vessel, and after changing her course were taken by a United States vessel off the American coast. The courts held that they were free, and not pirates or robbers — **Bankers' case**, or **case of the bankers**, the petition of Hornblow and others to the barons of the exchequer in 1691 (14 How St. Tr. 1) for the payment of certain annuities granted by Charles II to repay money originally loaned to him on the security of the revenues. On appeal, the House of Lords decided that the grant was binding upon his successor, and continued a charge upon the revenue — **Bates' case**, an English prosecution (1606) of a merchant, in which the claim of James I to impose duties as a personal prerogative was sustained, a question afterward settled the other way under Cromwell. Also called the **case of the impositions** — **Bradlaugh's case**, a prolonged controversy (1881-86) over the claim of Charles Bradlaugh (a) to take a seat in the House of Commons without taking the oath required of members he declaring that he did not acknowledge or believe in its obligation, and later (b) to have the oath administered. Two notable legal decisions were reached in the course of the controversy. In 1884 (12 Law Rep. Q. B. D. 271), in the case of Charles Bradlaugh v. Francis R. Gaisett, sergeant at arms of the House of Commons, arising out of a resolution excluding plaintiff from the House until he should engage not to disturb its proceedings by demanding to take the oath as a member, it was held that courts cannot control the House in its administration of laws relating merely to its internal procedure, nor inquire into the propriety of a resolution restraining a member from doing in the House what he had a lawful right to do, and that action will not lie against the sergeant-at-arms for obeying such resolution. In 1885 (14 Law Rep. Q. B. D. 667), in the Court of Appeal, the case of the Attorney General v. Bradlaugh, for penalties under the Parliamentary Oaths Act, for voting in the House without having been sworn as a member, it was decided that a member who does not believe in a Supreme Being, and upon whom an oath is binding only as a promise, is incapable of taking the prescribed oath, but if he goes through the form of taking it (as Bradlaugh did by administering the oath to himself at the bar of the House), he is liable for violation of the act — **Burr's case**, the prosecution of Aaron Burr for treason against the United States, tried before Chief Justice Marshall in 1807 — **Calvin's case**, also called the **case of the postnati**, 1608 (2 How St. Tr. 659, 7 Coke, 1), an action turning on questions of allegiance and natural born subjects. It was brought to recover lands by Robert Calvin against Richard and Nicholas Smith, to which defendants pleaded that the plaintiff was an alien, and incapable of bringing the action, because he was born in Scotland, though after the crown of England descended to James I, who was also king of Scotland. It was argued by lawyers and judges of the greatest renown, including Lords Bacon, Coke, Filmer, Yelverton, and Warburton, and was decided in favor of the plaintiff — **Case agreed**, or **case stated**, in law, a statement of facts agreed on by the parties, or made by an other court, to be submitted merely for decision of a point of law — **Case law** See **law** — **Case of conscience** See **conscience** — **Case of the Caroline**, a name given to the case of the People v. McLeod. See **McLeod case**, below — **Case of the claimant** See **Tichborne case**, below — **Case of the seven bishops** See **bishop** — **Case reserved**, case made, a statement presenting points of law reserved by the judge or parties for decision by the full court — **Civil rights cases** See **civil** — **Clinton bridge case**, an important litigation in the United States Supreme Court (1870), which established the doctrine by which railroad bridges may be said to have gained clear recognition of their rights of way in preference to the navigable waters crossed by them, through the power of Congress to regulate interstate commerce — **Criminal cases** See **criminal** — **Crown cases reserved** See **crown** — **Darnell's case**, a noted case in English constitutional law (1627), in which the imprisonment of Sir Thomas Darnell and four others, for refusing to subscribe to a forced loan, was sanctioned, the agitation resulting from which was followed by the granting of the Petition of Right — **Dartmouth College case**, the leading American case (1819) on the vested rights of corporations, reported as Trustees of Dartmouth College v. Woodward (4 Wheaton, 518), deciding that a corporate charter, even though it be a British charter granted before the revolution, cannot be materially altered by a State legislature, it being a contract within the meaning of the provision of the United States Constitution which deprives the States of the power to impair the obligation of a contract — **Dr Bonham's case**, an important decision upon English constitutional law, rendered in 1609, in the case of Thomas Bonham v. the College of Physicians (8 Coke, 107), for false imprisonment. It was held that an act of Parliament which is against common right and reason, or is impossible to be performed, is void by the common law, also, that where the power to commit to prison is vested by patent or act of Parliament in parties not being a court, their proceedings ought to be of record, and the facts upon which such power is exercised are traversable — **Dred Scott case**, a case of great historical importance among the events which preceded the abolition of slavery in the United States, in which the Supreme Court held (in 1857) that a free negro of slave ancestry was not a citizen, and could not sue or be protected as such in the United States courts. The statement that the Africans in America had long been considered a subordinate race having "no rights which the white man is bound to respect," which was contained in the opinion of the chief justice, gained universal attention as a point of attack in the controversy about slavery — **Five per cent. cases**, a decision of the United States Supreme Court in 1884 (110 U. S. 471), holding that an act of Congress by which a percentage of the proceeds of land "sold by Congress" is reserved to certain public uses of a State does not include lands disposed of by the United States in satisfaction of military land-warrants — **General case**, in math that special state of things which is considered when, in studying an analytical expression, it is assumed that there is no peculiar relation between the constants denoted by letters. The general case may be very exceptional. Thus, in linear associative algebra, in the general case the vanishing of a product implies the vanishing of one of the factors, yet among the innumerable possible algebras there are but three in which such an inference is

valid — **Hampden's case** See **case of ship-money**, under **ship-money** — **In case**, in the event of contingency, if it should so fall out or happen that, supposing

**Irreducible case**, in math, the case in which a cubic equation has three real roots, when Cardan's method of solution involves imaginary numbers — **Kendall's case**, a decision of the United States Supreme Court (1838), noted in American constitutional law, that the court may compel a cabinet officer to perform a ministerial duty — **Koszta's case**, the facts and resulting diplomatic correspondence (1853) by which the United States Government maintained the claim that Martin Kosztka, a native of Hungary, was entitled to protection as an American citizen from seizure by the Austrian government while in Turkish jurisdiction, he having previously legally declared his intention to become an American citizen — **Marbury's case**, a decision of the United States Supreme Court (1803) noted in American constitutional history, which established the power of that court to declare an act of Congress void for contravening the United States Constitution, and defined the extent to which members of the cabinet are amenable to the courts — **McLeod case**, a controversy between the United States and Canada, arising out of the incident of the destruction of the American steamer *Tarleton* by the Canadian authorities (1847), in the course of which a man was killed. McLeod was arrested as one of the attacking party and was indicted (1841) in New York State for murder, but he proved an alibi, and was acquitted. Also called the **case of the Caroline** — **Negro case** See **Sommerett's case**, below — **Shelley's case**, the decision in 1581 (1 Coke, 89-100), by all the judges of England, of the case of Nicholas Wolfe against Henry Shelley, in ejectment, involving questions upon the law of common recoveries. It is chiefly celebrated for a precise and clear statement of defendant's counsel of a previously well-established rule of law concerning the effect of the word "heirs" in certain conveyances, since known as the rule in Shelley's case. This rule, which is now regarded as a rule of interpretation rather than a rule of law, is to the effect that wherever there is a limitation to a man, which if it stood alone would convey to him a particular estate of freehold, followed by a limitation to his heirs or to the heirs of his body (or equivalent expressions), either immediately or after the interposition of one or more particular estates, the apparent gift to the heir or heirs of the body is to be construed as a limitation of the estate, that is to say, not a gift to the heir but a gift to the person first named of an estate of inheritance, such as his heirs may take by descent — **Sommerett's case**, a famous habeas corpus case in England in 1772, before Lord Mansfield, brought on behalf of Thomas Sommerett, a negro. It established the principle that a slave brought upon English soil became thereby free. Also called the **negro case** — **Special case**, a statement of facts agreed to on behalf of two or more litigant parties, and submitted for the opinion of a court of justice as to the law bearing on the facts so stated. In Scots law, in civil jury cases, a special case differs from a special verdict only in this that the special verdict is returned by the jury, whereas the special case is adjudged by the parties themselves, or by their counsel, and sets forth the special facts on which they are agreed without the evidence — **Taltarum's case**, a noted decision in the English courts in 1473, establishing the power of a tenant in tail to convert the estate into a fee simple absolute by suffering a common recovery — **Tennessee bond cases**, a name given to seventeen cases decided by the United States Supreme Court in 1885 (114 U. S. 899, 115, 603), wherein it was held that the statutory lien upon railroads created by act of the Tennessee Legislature, Feb. 11th, 1852, was for the benefit of the State, and not of the holders of State bonds issued under that act — **Tichborne case**, also called the **case of the claimant**, the name given to the history and proceedings of Thomas Castro, otherwise Arthur Orton, in his claim to be Sir Roger Tichborne, and heir to the estate and barony of Tichborne in England (1868-74), which he prosecuted by suits in Chancery and in the Courts of Probate and of Common Pleas, and which culminated in his trial and sentence to fourteen years' imprisonment for perjury. The case is celebrated for the conflicting nature of the testimony as to his identity, and for the great public interest excited by it — **To put the case**, to suppose the event or a certain state of things, state a question, especially in a manner to invite decision — **Tweed's case**, the proceedings against William M. Tweed and others known as the Tweed Ring, for frauds perpetrated while they were municipal officers of New York, by which they obtained over six million dollars from the county of New York. In a civil case it was decided by the Court of Appeals of New York in 1874 (People v. Ingraham, 58 N. Y. 1) that an action for money fraudulently obtained from a county could not be brought in the name of the people of the State. This was subsequently remedied by statute, and a judgment obtained. In a criminal case, Tweed was found guilty on twelve counts for similar offenses in our indictment, and was separately sentenced to one year's imprisonment on each, with the direction that service of one sentence should not begin until the completion of service on a prior sentence. After completing the term of his first sentence, a writ of habeas corpus was served on his jailer, and the Court of Appeals in 1875 (People ex rel. Tweed v. Liscomb, 60 N. Y. 550) decided that, under the statutes conferring the power to sentence cumulative sentences in such cases were not lawful, and discharged him, but he was immediately imprisoned in default of bail in preceding civil suits. Other minor decisions on questions of procedure are also included under this term — **Twyne's case**, the leading case in English law (1603) holding that a conveyance intended to defraud creditors is void as against them, if not taken in good faith and for valuable consideration — **Tyrrel's case**, a noted decision in English law (1558), in which after Parliament, by the statute of uses, had thought to put an end to the holding of land in the name of one person to the use of another, the courts introduced the doctrine of a use upon a use, leading to the present law of trusts — **Virginia coupon cases**, the generic name under which are known a number of suits determined by the United States Supreme Court in 1884, enforcing a Virginia statute which declared coupons on bonds of that State receivable in payment of State taxes, notwithstanding

the repeal of that statute — **Wheeling bridge case**, the case of Pennsylvania v. Wheeling and Belmont Bridge Co. decided by the United States Supreme Court (in 1851 and 1855), concerning a bridge across the Ohio river at Wheeling, Virginia. After holding in 1851 (38 How. 518), by a divided court, that a bridge, though entirely within the jurisdiction of the State that authorized its construction, could be enjoined as a nuisance by the courts of the United States if it obstructed interstate navigation, the court held in 1855 (38 How. 421) that Congress, under the constitutional power to regulate commerce between the States, may determine what shall or shall not be deemed an obstruction to navigation, and may declare a bridge, when erected, to be a lawful structure, so as to avoid the effect of its having been judicially declared a nuisance — **Wild's case**, an English decision, in 1590 (8 Co. Rep. 16 b) in the case of Richardson v. Wadley, in ejectment, so called because involving a device to one Rowland Wild, which established the rule for the construction of wills known as the rule in Wild's case, viz. "that if a devise lands to B and his children or issues, and he hath not any issue at the time of the devise, that the same is an estate tail — **Syn.** Situation, condition, state, circumstances, plight, predicament.

The *upper case* (so called from its higher position on the inclined composing frame), of 98 boxes, which contains the capitals, small capitals, reference marks, fractions, and other types in small request, and the *lower case*, of 55 boxes of unequal size, which contains the small text types, spaces, and points most frequently required. The *cases* and boxes are arranged so that the types oftentimes used are most easily reached by the compositor. **Cased glass**, glass made in several layers, usually of different colors, by cutting through which to different depths an effect like that of cameo is produced. The ancient Roman glass of this kind was cut by hand in the manner of gem cutting. The process in use at the present day consists in covering the outside of a colorless glass ball with a thin case of colored glass, and fusing the two together, repeating the operation as often as desired, the whole is then blown into the shape required before the cutting is done. Also called *cameo glass*. — **Cased sash-frames**, sash frames which have their interior vertical slides hollow to admit the weights which balance the sashes, and at the same time conceal them.

*caste*<sup>1</sup>, a. A Middle English variant of *chaste*. *caste*<sup>2</sup> (kást), n. [Formerly *cast*, only recently as *F. caste*, < *Pg. casta* (> *Sp. casta*), breed, race, caste; first applied to the classes of the Hindus by the Portuguese, who were the earliest colonists in India, prop. fem. of *casto*, < *L. castus*, pure, > *OF. chaste*, *E. chaste*, q. v.] 1. One of the artificial divisions or social classes into which the Hindus are rigidly separated according to the religious law of Brahmanism, and of which the privileges or disabilities are transmitted by inheritance. The principal castes are four in number: 1st, the Brahmins, or the sacerdotal caste, 2d, the Kshatriyas, modern Rajputs, or military caste, 3d, the Vaisyas, or husbandmen and merchants, who have now in many districts become merged in the second and fourth castes, 4th, the Sudras, or laborers and mechanics. The Brahmins are supposed to have sprung from the mouth of Brahma, the Kshatriyas from his arms, the Vaisyas from his belly and thighs, and the Sudras from his feet. The Brahman represents religion, the Kshatriya, war, the Vaisya, commerce and wealth, and the Sudra, labor. There are many subdivisions of caste, and although the Sudras are degraded far below the Brahmins, Kshatriyas, and Vaisyas, there are reckoned thirty-six subdivisions lower than the Sudras. Lowest of all are the Pariahs, who are supposed to be of no caste, and mere outcasts from humanity. Of the castes, the first three are the natural and gradually established divisions of the Aryan invaders and conquerors of India, the fourth was made up of the subjugated aborigines. The Sanskrit name for caste is *varna*, color, the different castes having been at first marked by differences of complexion, according to race, and in some degree according to occupation and consequent exposure. Besides the original castes, numerous mixed classes or castes have sprung up in the progress of time, and are dependent upon trade, occupation, or profession, in fact, the casual principle in the system of caste is the confining of employments to hereditary classes. Castes are, according to Indian social standards, either "high" or "low." The same term is also used of somewhat similar classes in other countries.

The system of caste involves the worst of all wrongs to humanity—that of hallowing evil by the authority and sanction of religion  
*Faiths of the World, p. 30*

To be subjugated by an inferior caste was a degradation beyond all other degradation  
*Macaulay, Hist. Eng.*

Offensive as is the low-caste Indian, I had rather see the lowest Pariah of the low, than a single trim, smooth faced, smooth wayed, clever high caste Hindoo on my lands or in my colony  
*W. G. Palgrave in Fortnightly Rev.*

Hence—2. A division of society, or the principle of grading society, according to external conditions; a class or grade separated from others by differences of wealth, hereditary rank or privileges, or by profession or employment.

Where the operations became hereditary, a system of caste arose. This system has never been rigid in Western Europe, however, as it has been in India and other countries of the East.

Castles, in the sense of fortified residences, were an outgrowth of institution of feudalism, and were first brought to a high pitch of strength and completeness by the Normans. In England there were few

or no castles properly speaking, till the time of William the Conqueror, after which a great many were constructed on the Norman model. At first the donjon or keep was the only part of the castle of great strength, and the other buildings in connection with it were of a more or less temporary nature. In the thirteenth century, however, the design of the castle became more fully developed, and the keep formed only the central part of a group of buildings, all supporting one another and mutually contributing to the strength and commandment of the whole. The cut shows the castle of Coucy, near Laon, France, built in the thirteenth century. In the foreground is the outer bailey or esplanade fortified and containing a chapel, stables, and other buildings. The outer entrance to this was formed by a barbican or antemural (see plan under *antemural*), a is the fosse 20 yards broad, b, the gate, approached by two swing bridges c, defended by two guard rooms and having a double portcullis within giving entrance to vaulted guard rooms with sleeping apartments, etc. above c, d, inner bailey or courtyard, e covered buildings for the men defending the walls or curtains f apartments for the family entered by the grand staircase g, h, great hall with storerooms and vaults below, i, donjon or keep (the chapel is seen behind it) the strongest part of the castle, with walls of immense thickness, suited to form the last retreat of the garrison. At k is a portcullis leading from the donjon and communicating with an outer portcullis drawbridge etc. l, m, n, o are the chief towers flanking the outer walls.

When the towers are represented with the windows and the joints between the stones of colors different from that of the wall, they are said to be masoned or windowed gables, or, or the like. When the windows are shown of the color of the field, the castle is said to be voided of the field, or sometimes ajouré. —A castle in the air, or in Spain, a visionary project, a vague imagination of possible wealth, fame, happiness, or the like, a day dream. (See below.)

To build castles in Spain, to build castles in the air. (See below.) The origin of this phrase (which is traced back in French literature to the thirteenth century, and in English to the fourteenth) is doubtful. It has been attributed to the boasting by Spanish adventurers in France of their lordly residences, which existed only in their imaginations, and less probably to a supposed prohibition at some time against the erection of fortifications in Spain. Littré thinks the idea is simply that of an imaginary castle in any foreign country other names having not so familiarly used, and that of Spain prevailing as most familiar, to which it may be added that its real origin is probably to be found in the notion, always prevalent of the attainment of great wealth through emigration or foreign adventure.

Thou shalt make castles thine in Spain,  
And dream of joys, all but in vain.  
Bacon, *Of the Rose*, l. 2573

To build (or make) castles in the air, to form schemes that have no practical foundation, to entertain projects that cannot be carried out, to indulge either seriously or in mere play of the imagination in pleasing day dreams, especially of great wealth or power.

**Casual ejector**, in law, the name given to the defendant in the fictitious action of ejectment formerly allowed by the common law where the real object of the action was to determine a title to land. To form the ground of such an action, the person laying claim to the land granted a lease of it to a fictitious person, usually designated John Doe, and an action was then brought in the name of John Doe against another fictitious person, usually designated Richard Roe (the casual ejector) who was stated to have illegally ejected John Doe from the land which he held on lease. The landholder was permitted to defend in place of Richard Roe, and thus the determination of the action involved the proving of the lessor's right to grant a lease. these catacombs probably served to some extent as places of refuge and concealment for Christians during the earlier persecutions, the original idea of their construction was undoubtedly that they should be used only as burial vaults. The length of the galleries in the Roman catacombs has been variously estimated at from 350 to 900 miles and the number of bodies there interred is said to be over 6,000,000. Similar underground burial places are found at Naples, Cairo, Paris, etc. Those of Paris are abandoned quarries extending under a large portion of the city, which were made into a hony in 1786, when the inhumane customs of the city were condemned and the bones were removed thither.

The modern catalfalque is generally without a canopy, and in Roman Catholic countries is surrounded by large tapers, which are burned during a day or two preceding the burial. The catalfalque is sometimes used as a bier in carrying the body to the grave or tomb at a public or ceremonious funeral.

In *Rom. antiq.*, a military engine used to throw darts of great size, called *phalarica* or *trifur*.

Catapult.

Its construction is nowhere explained with any fullness, and it is uncertain whether its action was that of a cross bow or whether springs were the propelling power. By later authors the catapult and ballista seem to be confounded. In the middle ages the name is hardly used, except where a writer is evidently seeking to give a classical form to his composition. In the annexed cut, which represents a catapult of the later period when no distinction was made between it and the ballista, *F* is the end of a strong lever, which revolves on an axis and is held down by a windlass, *A*. At the extremity is a fork, *E E*, with the prongs curving slightly upward so as to afford a bed for a barrel of combustible matter or a heavy missile confined by a rope with a loop at the end, the loop being passed through a hook, *D*. When the lever was released it bounded suddenly upward, the centrifugal force causing the loop *C* to slip off the hook, whereupon the barrel in its fall was liberated and projected toward its object. *B* shows rings of iron, stone or lead, intended to increase the rebound due to the stretched cables or other devices which furnished the propelling force.

Bring up the catapults, and shake the wall.

A *secondary cataract* is one due to an earlier disease of the eye. Cataracts are probably incurable except by surgical treatment. It was once generally believed that the earth has "undergone a succession of revolutions and aqueous *catastrophes* interrupted by long intervals of tranquillity (*Lyril*). The deluge was one of these great *catastrophes*. A similar view is the once common idea that all the living organisms on the earth's surface had been again and again exterminated, to be succeeded by new creations of plants and animals.

Great changes of a kind and intensity quite different from the common course of events, and which may therefore properly be called *catastrophes*, have taken place upon the earth's surface.  
H. Hensell.

The old notion of all the inhabitants of the earth having been swept away by *catastrophes* at successive periods is very generally given up, even by those geologists as Elihu de Beaumont, Murchison, Harland, etc. whose general views would naturally lead them to this conclusion.  
Darwin, *Origin of Species*, p. 299.

**Theory of catastrophes**. See *theory of catastrophes*, in *der catastrophism* = *Syl. 2*. *Dunster*, *Catastrophism*, etc. (see *mis fortune*), consummation, finale.

**catastrophic** (kat-as'trof'ik), *a* [< *catastrophe* + *-ic*.] 1. Pertaining to or of the nature of a catastrophe; cataclysmic.

Revolution seems to contain in every syllable of its terrifying name something *catastrophic*.  
Contemporary Rev., I, 436.

2. Relating to or in conformity with the views of the catastrophists, cataclysmal.

The hypothesis of uniformity cannot possess any essential simplicity which, previous to inquiry, gives it a claim upon our assent superior to that of the opposite *catastrophic* hypothesis.  
H. Hensell.

3. Subversive in a momentous degree of settled usage or law.

The *catastrophic* creation of Poems for the purpose of swamping the upper house is a power only to be used on great occasions, when the object is immense, and the party strife unmitigated.  
Bagehot, *Eng. Const.* (Boston ed.) p. 305.

**catastrophism** (ka-tas'trō-fizm), *n.* [< *catastrophe* + *-ism*, = F *catastrophisme*.] The theoretical view of geological events which has as its essential basis the idea of a succession of catastrophes the opposite of *uniformitarianism*. See *catastrophe*, 3, and *cataclysm*, 2.

I find three, more or less contradictory, systems of geologic thought, each of which might fairly enough claim these appellations standing side by side in Britain. I shall call one of them *Catastrophism*, another *Uniformitarianism*, the third *Evolutionism*. By *Catastrophism* I mean any form of geological speculation which in order to account for the phenomena of geology, supposes the operation of forces different in their nature, or immeasurably different in power from those which we at present see in action in the universe.  
Huxley, *Lay Sermons*, p. 229.

**catastrophist** (ka-tas'trō-fist), *n.* [< *catastrophe* + *-ist*.] One who believes in catastrophism, a catastrophist. The term is used in geology by writers on theoretical dynamic geology as the opposite of *uniformitarianism*, that is, of one who considers that geological causes now in action are and have been, essentially the same from the beginning. The catastrophist maintains that there have been catastrophes or sudden violent changes in the order of nature, such for instance, as would cause the extermination of all forms of life upon the globe, or cover it with ice.

The *catastrophist* is affirmative, the *uniformitarian* is negative in his assertions.  
H. Hensell.

For a generation after geologists had become uniformitarians in geology, they remained *catastrophists* in biology.  
H. Spencer, *Data of Ethics*, § 17.

But Catawba who  
Has a taste more divine,  
More dulcet, delicious, and creamy

It abounds in the shrubbery.

**cat-boat** (kat'bōt), *n.* A boat having a cat-rig. In England cat boats are known as *Una boats*, probably from the name of the first cat rigged boat used there.

The word was introduced by Aristotle, who applies it to his ten predicaments, things said, or summa genera, viz. substance, quantity, quality, relation, action, passion, where, when, position or relative position of parts, habit or state. These are derived from such an analysis of the proposition as could be made before the developed study of grammar. The categories or highest intellectual concepts of Kant are: categories of quantity — unity, plurality, totality, categories of quality — reality, negation, limit between these categories of relation — substance and accident, cause and effect, action and reaction, categories of modality — possibility, impossibility, actuality, non-actuality, necessity, non-necessity. Mod. in formal logic furnishes this list (1) qualities, or singular characters, (2) simple relations, or dual characters, (3) complex relations, or plural characters. Many lists of categories have been given not founded on formal logic

In this sense it is generally applied to the ancient historical church, its faith and organization down to the time of the great schism between the *sees* of Rome and Constantinople as, a *Catholic bishop* or *synod*, as distinguished from a Nestorian or Jacobite prelate or council.

The impurity of heretics made them [the Church of Christ] add another name to this [Christian] viz. that of *catholic*, which was, as it were, their surname or characteristic, to distinguish them from all sects, who, though they had party names, yet sometimes shirked their selves under the common name of Christians. *Brigham*, Antiq., I i 7

(e) [*cap.*] Claiming to possess exclusively the notes or characteristics of the one, only, true, and universal church—unity, visibility, indefectibility, succession, universality, and sanctity, used in this sense, with these qualifications, only by the Church of Rome, as applicable only to itself and its adherents, and to their faith and organization, often qualified, especially by those not acknowledging these claims, by prefixing the word *Roman*. (f) More specifically, an epithet distinguishing the faith of the universal Christian church from those opinions which are peculiar to special sects. The measure was urged with special reference to the Roman Catholics of Ireland. — **Old Catholics**. (a) The name used by a small body of believers in humanism in Holland, with an archiepiscopal see in Utrecht. They have continued since 1724 to recognize the authority of the pope by sending him notice of each new election of a bishop, which he always disavows. (b) A reform party in the Roman Catholic Church founded after the proclamation of, and in opposition to, the dogma of papal infallibility proclaimed by the Vatican Council in 1870. A schism with the Roman Catholic Church was not intended, but it resulted, the leaders were excommunicated and new congregations formed. No bishop having joined the movement, the ordination of a bishop was obtained from the Old Catholic bishop of Devon in Holland. Old Catholics have departed in few respects from their former ecclesiastical customs as Roman Catholics. Anglican confession and fasting are however, voluntary with them, and priests are allowed to marry. Mass is permitted to be said in the vernacular. They are found chiefly in Germany and in Switzerland, where they call the nucleus *Christian Catholics*. — **Roman Catholic Relief Acts**, a series of English statutes removing the political disabilities of Roman Catholics as, 1829 (10 Geo. **caucus** (kā'kus), *n* [This word originated in Boston, Massachusetts. According to a com-

But such a corruption and forgetfulness of the orig. meaning of a word so familiar as *calkers* is improbable, and, moreover, the word *caucus* occurs at least 7 years earlier, in the following passage in the diary of John Adams: "Feb. . . , 1763—This day learned that the *Caucus* Club meets at certain times in the garret of Tom Dawes, the adjutant of the Boston (militia) regiment." This indicates the origin of the term *caucus*, as a private meeting for political purposes, in the name of a club of that nature, called the "*Caucus* Club." The origin of the name as applied to the club is not known, but if not an arbitrary term, chosen for its alliterative form and feigned mysterious import, it may have been a learned adoption, in allusion to the convivial or symposiastic feature of the club, of the *ML. caucus*, < *ML. Kankor* (also *Kankor*, *Kanka*, with *dim. Kankorion*), a cup.] 1. See **accuse**, **excuse**] 1 That by the power of which an event or thing is, a principle from which an effect arises, that upon which something depends per se, in general, anything which stands to something else in a real relation analogous to the mental relation of the antecedent to the consequent of a conditional proposition. Nominalist philosophers commonly hold that every effect is the result not of one but of many causes (see **total cause**, below), but the usual doctrine is that the effect is an abstract element of a thing or event, while the cause is an abstract element of an antecedent event. Your kinds of causes are recognized by Aristotelians the **material**, **formal**, **efficient**, and **final cause**. **Material cause** is that which gives being to the thing the matter by the determination of which it is constituted, **formal cause**, that which gives the thing its characteristics, the form or determination by which the matter becomes the thing, **efficient cause**, an external cause preceding its effect in time, and distinguished from **material** and **formal cause** by being external to that which it causes, and from the end or **final cause** in being that by which something is made or done, and not merely that for the sake of which it is made or done, **final cause**, an external cause following after that which it determines (called the **means**), the end for which the effect exists. Other divisions of causes are as follows: **subordinate** or **second cause**, one which is itself caused by something else; **proximate** or **immediate cause**, one between which and the effect no other cause intervenes, or, in *law*, that from which the effect might be expected to follow without the concurrence of any unusual circumstances, **remote cause**, the opposite of **proximate cause**, **total cause**, the aggregate of all the antecedents which suffice to bring about the event, **partial cause**, something which tends to bring about an effect, but only in conjunction with other causes, **emanative cause**, that which by its mere existence determines the effect, **active cause**, that which brings about the effect by an action or operation, termed the **causation**, **instrumental cause**, that which brings about some effect within itself, as the mind calling up an image, **transient cause**, that whose effect lies outside itself, **free cause**, that which is self-determined and free to act or not act, opposed to **necessary cause**, **principal cause**, that upon which the effect mainly depends, **instrumental cause**, a cause subservient to the principal cause. The above are the chief distinctions of the Aristotelians. The physicians, following Galen, recognized three kinds of causes, the **procatartec**, **progenital**, and **synectic**. The **procatartec cause** is an antecedent condition of things outside of the prin-

pal cause, facilitating the production of the effect; the **progenital cause** is that within the principal cause which either predisposes or directly excites it to action, and the **synectic, containing, or continient cause** is the essence of the disease itself considered as the cause of the symptoms, thus typhoid fever might be referred to as the **continient cause** of other stools or a quickened pulse. Other varieties are the **occasional cause** (see **occasionalism**), **moral cause**, the person inciting the agent to action, **objective cause**, the ideas which excite the imagination of the agent, and **sufficient cause**, one which suffices to bring about the effect (see **sufficient reason**, under **reason**).

In virtue of his character as knowing, therefore, we are entitled to say that man is, according to a certain well defined meaning of the term, a free cause

*T. H. Green*, Prolegomena to Ethics, § 74

**Cause** is the condensed expression of the factors of any phenomenon, the effect being the fact itself

*G. H. Lewes*, Probs. of Life and Mind, II v § 19

Of these two senses of the word **cause**, viz., that which brings a thing to be, and that on which a thing under given circumstances follows, the former is that of which our experience is the earlier and more intimate, being suggested to us by our consciousness of willing and doing *J. H. Newman*, Gram. of Assent, p. 65

Specifically—**2**. An antecedent upon which an effect follows according to a law of nature; an efficient cause. The common conception of a cause, as producing an effect similar to itself at a later time and without essential reference to any third factor, is at variance with the established principles of mechanics. Two successive positions of a system must be known, in addition to the law of the force, before a position can be predicted, but the common idea of a cause is that of a single antecedent determining a consequent of the same nature. Moreover, the action of a force is strictly contemporaneous with it and comes to an end with it, and no known law of nature coordinates events separated by an interval of time

**3**. The reason or motive for mental action or decision, ground for action in general.

4 In *arch* See *cella*, 1—5 In *bol* (a) The fundamental form-element of every organized body. It is a bioplasmic mass of protoplasm, varying in size and shape generally of microscopic dimensions, capable under proper conditions of performing the functions of sensation, nutrition, reproduction, and automatic or spontaneous motion, and constituting in itself an entire organism, or being capable of entering into the structure of one. Such a cell as a rule has a nucleus, and is usually also provided with a wall or definite boundary, but neither cell nucleus nor cell wall necessarily enters into its structure. In ultimate morphological analysis, all organized tissue is resolvable into cells or cell products. See *protoplasm*, and *cell theory*, below (b) Specifically, a nucleated capsulated form-element of any structure or tissue, one of the independent protoplasmic bodies which build up an animal fab-

If a single cell, under appropriate conditions, becomes a man in the space of a few years, there can surely be no difficulty in understanding how, under appropriate conditions, a cell may in the course of untold millions of years give origin to the human race

8 In *elect.*, a single jar or element of a voltaic battery. A simple cell ordinarily consists of plates of two different metals joined by a wire and immersed in a liquid (called the exciting liquid) which acts chemically upon one plate, this the positive or generating plate, at the expense of which the electrical current is maintained, is usually zinc, the negative plate is often copper, but may be platinum, carbon silver, etc. The exciting liquid is commonly dilute sulphuric acid, but solutions of salt ammoniac, common salt, etc., are also used. The current flows through the liquid from the positive plate (zinc) to the copper, and through the wire from the positive pole to the negative pole (see figure)

The current from a simple voltaic cell soon loses its strength, because, hydrogens bubbles, liberated in the chemical action on the negative plate, form a film over it. This polarization of the negative plate (see *polarization*) may be partially avoided by mechanical means in a simple fluid cell, by using platinum, or silver, covered with finely divided platinum, as in the *Snow* cell, or platinum (carbon, as in the *Walker* cell. It is more effectively prevented in a *two fluid cell* by the addition of a second liquid (the depolarizing liquid), with which the hydrogen combines chemically. In the *Grove* cell, or *bottle cell*, of chromate of potash is mixed with the sulphuric acid (being hence called a *chromate cell*) in a vessel of bottle form, and the zinc and carbon are immersed in them, the zinc, however, is raised out of the liquid when the cell is not in use. Practically, the depolarizing liquid is usually separated from the exciting liquid, as in the *compound cell*. One of the best of these is the *Daniell* cell, which consists of a zinc plate immersed in dilute sulphuric acid contained in a porous vessel, outside of which is a perforated copper plate surrounded by a solution of copper sulphate. The action is as follows: The reaction between the zinc and sulphuric acid produces zinc sulphate and hydrogen, the latter, however, instead of collecting on the copper plate, unites with the copper sulphate, forming sulphuric acid and metallic copper. The former goes to keep up the supply of acid in the inner vessel, and the latter is deposited on the copper plate. The consumption of copper sulphate is made good by a supply of crystals in a receptacle at the top. A modified form of the Daniell cell is the *gravity cell*, in which the porous vessel is done away with, and the two liquids are separated by their specific gravities, the copper sulphate surrounds the copper plate at the bottom, and the zinc sulphate the zinc plate at the top. This is the form of cell most used for telegraphic purposes in the United States. Other forms of the compound cell are the *Grove*, in which platinum and nitric

acid are used, and the *Wiedemann* cell, in which the zinc and copper plates are separated by a porous vessel, and the zinc is raised out of the liquid when the cell is not in use.

acid take the place of the copper and copper sulphate of the Daniell, the Bunsen, which is like the Grove except in the use of carbon instead of platinum, and there are many others. The *Leclanché cell*, much used in connection with electric call bells (as also with the telephone), consists of a rod of zinc immersed in a solution of sal ammoniac, and a plate of carbon, sometimes, though not necessarily, in a separate porous vessel packed about with powdered manganese dioxide and carbon. its strength, and hence is especially valuable for intermittent use. It has also the advantage that there is no waste of the zinc by local action when not in use. The *silver chloride cell*, as devised by De la Rue, consists of zinc acted upon by sal ammoniac and a rod of silver surrounded by a cylinder of silver chloride. The *Latimer Clark standard cell* consists of zinc and pure mercury separated by a paste made from sulphates of zinc and mercury, when suitably arranged it maintains a very constant electromotive force, and hence has been used as a standard.

solved the celebrated problem of parallel motion. It is composed of two long links of equal length, pivoted together at one end and at the other pivoted to the opposite angles of a rhombus composed of four equal and shorter links. For use, the junction, A, of the two long links is fixed in position, and an extra link, BC, is attached to the angle of the rhombus nearest to A. The other end, B, of the extra link is fixed in position usually at a distance from A equal to BC. In this case, when BC turns about B as a center, the vertex, E, of the rhombus most distant from A will describe a right line. The production of this effect by link work alone had been much sought after since the invention of the steam engine. — **Principal cells,** the central cells of the cardiac glands of the stomach. It rarely or never exists in a simple condition unaltered by coloring or mineral matters, etc. and with age it becomes largely transformed into lignin, suberin, or mucilage. Cotton and the bleached fiber of flax and hemp are nearly pure cellulose, and in some filter paper it is almost chemically pure. Cellulose is remarkable for its insolubility, being dissolved without change only by an ammoniacal solution of oxid of copper, from which it may be again precipitated. Under the action of concentrated or boiling acids, or of caustic alkalis, many different products are obtained, according to the method of treatment. It is changed to glucose by long boiling with dilute sulphuric or hydrochloric acid, a substance resembling parchment or obtained by treating unsized paper with cold sulphuric acid, strong nitric acid, or a mixture of nitric and sulphuric acids, converts forms of cellulose into gun cotton, etc. In its unchanged condition it is not colored by iodine except usually with a faint yellowish tint, which becomes a bright blue on the addition of strong sulphuric acid. **celt**<sup>2</sup> (selt), *n.* [W. *celti*, a flintstone.] In *archaeol.*, an implement or weapon widely used among primitive and uncivilized races, and having the general form of a chisel or an ax-blade.

In the eighteenth century the name was given to the stone and bronze implements of this general shape, without careful consideration of their probable uses. The stone celts are all of a form more or less closely resembling the head of a hatchet, differing only in being sometimes flatter and with a longer cutting edge, sometimes of a section nearly circular, pointed at one end, and coming abruptly to an edge at the other. The bronze celts, the forms of which are very varied, may be divided into three principal classes. First, chisel-shaped blades without sockets, but with raised rims on each side forming a pair of grooves, apparently intended to retain a wooden handle fitted on in the direction of the length of the blade, these may be considered as spades intended for agricultural labor. Second, chisel-shaped blades, having a deep socket at the end opposite the cutting edge, and usually fitted with a loop or pierced ear on one side. Third, blades, also with a socket, but shorter and broader, these, which have often been called ax heads, are thought rather to be ferrules for the butt end of spear shafts and the like, the edge enabling them to be driven into the ground. See *amarn*, *paalstab*, *pot-celt*, and *socket-celt*.
